# Danger

**HAZARDOUS VOLTAGE**

- Read and understand this manual before installing or operating the ALTIVAR 11 drive controllers. Installation, adjustment, repair, and maintenance must be performed by qualified personnel.
- The user is responsible for conforming to all applicable code requirements with respect to grounding all equipment.
- Many parts in this drive controller, including printed wiring boards, operate at line voltage. DO NOT TOUCH. Use only electrically insulated tools.
- DO NOT touch unshielded components or terminal strip screw connections with voltage present.
- DO NOT short across terminals PA and PC or across the DC capacitors.
- Install and close all covers before applying power or starting and stopping the drive controller.
- Before servicing the drive controller:
  - Disconnect all power.
  - Place a “DO NOT TURN ON” label on the drive controller disconnect.
  - Lock the disconnect in the open position.
- Disconnect all power including external control power that may be present before servicing the drive controller. WAIT 15 MINUTES for the DC bus capacitors to discharge. Then follow the DC bus voltage measurement procedure beginning on page 22 to verify that the DC voltage is less than 45 Vdc. The drive controller LEDs are not accurate indicators of the absence of DC bus voltage.

Failure to follow this instruction will result in death or serious injury.

INTRODUCTION

The ALTIVAR 11 (ATV11) family of adjustable speed AC drive controllers is used for controlling three-phase asynchronous motors. The controllers range from:

- 0.25 to 3 hp (0.37 to 2.2 kW), 208/230/240 V, single-phase input
- 0.25 to 3 hp (0.37 to 2.2 kW), 208/230/240 V, three-phase input
- 0.25 to 1 hp (0.37 to 0.75 kW), 100/115/120 V, single-phase input

ATV11 controllers have been designed for the global marketplace with three regional adaptations. Each version of the product has the same wiring configuration and functionality. The variations among the regional versions are summarized in the following sections.

North American (U) Range (ATV11\textsuperscript{U})

- Designed for the North American market.
- Current ratings meet or exceed NEC requirements (see pages 9–11).

European (E) Range (ATV11\textsuperscript{E})

- Designed for the European market.
- Available only in 230 V single-phase input line voltage.
- Current ratings have been adapted to meet European standards (see pages 9–11).
- Has an integrated EMC filter to meet European CE requirements.

Asian (A) Range (ATV11\textsuperscript{A})

- Designed for the Asian market.
- Current ratings have been adapted to meet Asian standards (see pages 9–11).
- Speed reference potentiometer and run/stop buttons have been integrated onto the keypad display for local operation (see pages 37, 45, and 54).
- Logic inputs can be configured for negative logic (see page 54).

This instruction bulletin covers the technical characteristics, installation, wiring, programming, and maintenance of all ATV11 drive controllers.
RECEIVING AND PRELIMINARY INSPECTION

Before installing the ATV11 drive controller, read this manual and follow all precautions.

- Before removing the drive controller from its packaging, verify that the carton was not damaged in shipping. Carton damage usually indicates improper handling and the potential for device damage. If any damage is found, notify the carrier and your Square D/Schneider Electric representative.
- After removing the drive controller from its packaging, visually inspect the exterior for shipping damage. If any is found, notify the carrier and your sales representative. Do not install a damaged device.
- Verify that the drive controller nameplate and label conform to the packing slip and corresponding purchase order.

CAUTION

DAMAGED EQUIPMENT

Do not operate or install any drive controller that appears damaged.

Failure to follow this instruction can result in injury or equipment damage.

STORING AND SHIPPING

If the drive controller is not being immediately installed, store it in a clean, dry area with an ambient temperature between -25 and +69 °C (-13 to +156 °F). If the drive controller must be shipped to another location, use the original shipping carton and packing material to protect it.

¹ Power ratings are for a switching frequency of 4 kHz in continuous operation. The switching frequency is adjustable from 2 to 16 Hz. Above 4 kHz, the drive controller will reduce the switching frequency if an excessive temperature rise occurs. The temperature rise is sensed by a PTC probe in the power module. Derate the nominal drive current as follows for continuous operation above 4 kHz: 10% for 8 kHz; 20% for 12 kHz; 30% for 16 kHz.

² Nominal voltage values: 208 V for the North American (U) Range; 200 V for the Asian (A) Range; 230 V for the European (E) Range.

³ For 60 seconds.

⁴ The symbol “•” in a catalog number indicates that the drive controller is available in two versions. For drive controllers with a heatsink, replace the “•” with an “H” (for example, ATV11HU09M2E). For drive controllers with a base plate, replace the “•” with a “P” (for example, ATV11PU09M2E).

**⚠️ WARNING**

**BRAKING RESISTOR OVERHEATING**

- Select the proper braking resistors for the application.
- Provide adequate thermal protection.
- Enclose the braking resistors in an enclosure that is suitable for the environment.

**Failure to follow this instruction can result in serious injury or equipment damage.**

| Analog input AI1           | 1 programmable analog input. Maximum sampling time: 20 ms, resolution 0.4%, linearity ±5%:  
|                            | • Voltage: 0–5 V or 0–10 V, impedance 40 kΩ  
|                            | • Current: 0–20 mA or 4–20 mA (without added resistance), impedance 250 Ω |
## Table 7: Electrical Characteristics (continued)

<table>
<thead>
<tr>
<th>Non-scaled parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logic inputs, LI</td>
<td>4 programmable logic inputs, impedance: 5 kΩ. Power supply: internal 15 V or external 24 V (minimum 11 V, maximum 30 V). With multiple assignments, several functions can be combined on a single input (example: LI1 assigned to forward and preset speed 2, LI3 assigned to reverse and preset speed 3). Positive logic: state = 0 if &lt; 5 V, state = 1 if &gt; 11 V. Maximum sampling time: 20 ms. Negative logic: available by programming only in A-range drive controllers. State = 0 if &gt; 11 V or unwired cable input, state = 1 if &lt; 5 V. Maximum sampling time: 20 ms.</td>
</tr>
</tbody>
</table>
| Output, DO           | Factory setting:
  - Pulse width modulation (PWM) type open collector output at 2 kHz. Can be used on a meter. 
  - Maximum current: 10 mA. 
  - Impedance: 1 kΩ; linearity: ±1%; maximum sampling time: 20 ms. Can be configured as a logic output:
  - Open collector logic output: impedance: 100 Ω, maximum: 50 mA. 
  - Internal voltage: see available internal supplies above. 
  - External voltage: maximum 30 V, 50 mA. |
| Relay outputs        | 1 protected relay logic output (contact open if there is a fault). Minimum switching capacity: 10 mA for 24 Vdc. Maximum switching capacity:
  - On resistive load (power factor = 1 and L/R = 0 ms): 5 A for 250 Vac or 30 Vdc 
  - On inductive load (power factor = 0.4 and L/R = 7 ms): 2 A for 250 Vac or 30 Vdc |
| Drive controller protection | Thermal protection against overheating via a built-in PTC probe in the power module 
- Short circuit protection between output phases 
- Overcurrent protection between output and ground phases at power-up only 
- Network overvoltage and undervoltage protection 
- Network single-phasing protection, in 3-phase |
| Motor protection     | Thermal protection is integrated in the drive controller by $I^2t$ calculation. Thermal memory is erased at power-up. |
| Ground insulation resistance | >500 MΩ (galvanic isolation) |
| Frequency resolution | Display 0.1 Hz 
- Analog inputs: 0.1 Hz for maximum 200 Hz |
| Time constant upon a change of setpoint | 5 ms |

### MOUNTING AND TEMPERATURE CONDITIONS

**DANGER**

**HAZARDOUS VOLTAGE**

Before working on this equipment:
- Disconnect all power.
- Place a “DO NOT TURN ON” label on the drive controller disconnect.
- Lock the disconnect in the open position.

Failure to follow this instruction will result in death or serious injury.
Install the drive controller vertically ±10° with the output power terminals at the bottom.

Do not place the drive controller close to heating sources.

Leave sufficient free space around the drive controller to ensure that air can circulate from the bottom to the top of the unit.

Leave a minimum of 0.4 in. (10 mm) of free space in front of the drive controller.

**NOTE:** Monitor the tHd parameter (in the SUP menu) during normal operation to verify the drive controller thermal state.

The following drive controllers include a fan. The fan automatically turns on when the drive controller is powered up.

- ATV11HU18F1A
- ATV11HU18F1U
- ATV11•U18M2U
- ATV11•U18M3U
- ATV11HU29
- ATV11HU41
MOUNTING DRIVE CONTROLLERS WITH BASE PLATES

ATV11P drive controllers can be mounted on a steel or aluminum machined surface, provided that:

- The maximum ambient temperature is 40 °C (104 °F).
- The drive controller is mounted vertically ±10°.
- The drive controller is mounted at the center of a surface exposed to open air, with a minimum thickness of 0.4 in. (10 mm) and with a minimum square cooling area (S) of 1.3 ft² (0.12 m²) for steel and 1 ft² (0.09 m²) for aluminum.
- The surface support area for the drive controller is a minimum of 5.6 x 2.9 in. (142 x 72 mm) with a machined surface smoothness of 100 µm and a roughness of 3.2 µm maximum.
- The tapped holes are milled lightly to remove any burrs.
- The whole support surface of the drive controller is coated with thermal contact grease.

NOTE: Monitor the tHd parameter (in the SUP menu) during normal operation to verify the drive controller thermal state.

Attach the drive controller using two M5 screws (not supplied).

Dim: in. (mm)
MOUNTING THE EMC PLATE

An EMC plate, VW3A11831 (ordered separately), is available for ATV11 drive controllers. To mount the EMC plate, align it with the holes in the drive controller heatsink and secure it with the two screws provided, as shown in the figures below. See pages 29–30 for wiring instructions.

MOUNTING IN A TYPE 12 OR IP54 METAL ENCLOSURE

Calculating Enclosure Size

The equation for calculating the maximum allowable thermal resistance of the enclosure, $R_{th}$ (°C/W), is as follows:

$$R_{th} = \frac{T_i - T_o}{P}$$

- $T_i$ = Max. internal ambient temp. (°C) around the controller
- $T_o$ = Max. external ambient temp. (°C) around enclosure
- $P$ = Total power dissipated in enclosure (W)

For the power dissipated by the drive controllers at rated load, see Tables 1–3 on pages 9–11.
The useful heat exchange surface area, $S$ (in$^2$), of a wall-mounted enclosure generally consists of the sides, top, and front. The minimum surface area required for a drive controller enclosure is calculated as follows:

$$S = \frac{K}{R_{th}}$$

R$th$ = Thermal resistance of the enclosure (calculated above)
K = Thermal resistance per square inch of the enclosure

**NOTE: Contact the enclosure manufacturer for $K$ factors.**

Consider the following points when sizing the enclosure:

- Use only metallic enclosures, since they have good thermal conduction.
- This procedure does not consider radiant or convected heat load from external sources. Do not install enclosures where external heat sources (such as direct sunlight) can add to the enclosure heat load.
- If additional devices are present inside the enclosure, consider the heat load of the devices in the calculation.
- The actual useful area for convection cooling of the enclosure varies depending upon the mounting method. The mounting method must allow for free air movement over all surfaces considered for convection cooling.

The following sample illustrates calculation of the enclosure size for an ATV11HU18M3U drive controller mounted in a Type 12 or IP54 enclosure.

- Maximum external temperature: $T_o = 25 \, ^\circ C$ ($77 \, ^\circ F$)
- Power dissipated inside the enclosure: $P = 38 \, W$
- Maximum internal temperature: $T_i = 40 \, ^\circ C$ ($104 \, ^\circ F$)
- Thermal resistance per square inch of the enclosure: $K = 186$

Calculate the maximum allowable thermal resistance, $R_{th}$:

$$R_{th} = \frac{40 \, ^\circ C - 25 \, ^\circ C}{38 \, W} = 0.395 \, ^\circ C/W$$

Calculate the minimum useful heat exchange surface area, $S$:

$$S = \frac{186}{0.395} = 470.9 \, \text{in}^2$$
Useful heat exchange surface area (S) of the proposed wall-mounted enclosure:

- Height: 28 in. (711 mm)
- Width: 24 in. (610 mm)
- Depth: 12 in (305 mm)

\[
S = (24 \times 28) + (24 \times 12) + 2(28 \times 12) = 1632\;\text{in}^2
\]

If the selected enclosure does not provide the required surface area or does not meet application needs, consider the following:

- Use a larger enclosure.
- Add a passive heat exchanger to the enclosure.
- Add an air conditioning unit to the enclosure.

**Ventilation**

When mounting the drive controller inside a Type 12 or IP54 enclosure:

- Mount the drive controller with the minimum clearances specified in “Mounting and Temperature Conditions” on page 16.
- Follow the installation precautions on page 22.
- A stirring fan may be necessary to circulate the air inside the enclosure to prevent hot spots in the drive controller and to distribute the heat uniformly to surfaces used for convection cooling.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CONDESNATION</strong></td>
</tr>
<tr>
<td>Where condensation is possible, keep the drive controller powered up when the motor is not running, or install thermostatically controlled strip heaters.</td>

</tr>
</tbody>
</table>
BUS VOLTAGE MEASUREMENT PROCEDURE

⚠️ DANGER

HAZARDOUS VOLTAGE

Read and understand the precautions on page 4 before performing this procedure.

Failure to follow this instruction will result in death or serious injury.

The bus voltage can exceed 400 Vdc. Use appropriately rated measuring equipment when performing this procedure. To measure the bus capacitor voltage:

1. Disconnect all power from the drive controller.
2. Wait 15 minutes to allow the DC bus to discharge.
3. Measure the DC bus voltage between the PA (+) and PC (–) terminals to verify that the DC voltage is less than 45 Vdc. Refer to “Power Terminals” on page 24 for the location of the terminals.
4. If the bus capacitors are not fully discharged, contact your local Square D/Schneider Electric representative—do not operate the drive controller.

ELECTRICAL INSTALLATION

Ensure that the electrical installation of this drive controller conforms to the appropriate national and local codes.

- Verify that the voltage and frequency of the input supply line and the voltage, frequency, and current of the motor match the rating on the drive controller nameplate.

⚠️ DANGER

HAZARDOUS VOLTAGE

Ground equipment using the provided ground connecting point as shown in the figure below. The drive controller panel must be properly grounded before power is applied.

Failure to follow this instruction will result in death or serious injury.
• Verify that resistance to ground is 1 Ω or less. Ground multiple controllers as shown in the figure. Do not loop the ground cables or connect them in series.

⚠️ WARNING

INADEQUATE OVERCURRENT PROTECTION

• Overcurrent protective devices must be properly coordinated.
• The National Electrical Code requires branch circuit protection. Use the fuses recommended on the drive controller nameplate to achieve published fault withstand current ratings.
• Do not connect the drive controller to a power feeder whose short circuit capacity exceeds the drive controller withstand fault rating listed on the drive controller nameplate.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

• Provide overcurrent protection. To achieve the fault-withstand current rating listed on the drive controller nameplate, install the line power fuses recommended on the drive controller nameplate.

⚠️ WARNING

IMPROPER WIRING CONNECTIONS

• Do not apply input line voltage to the output terminals (U, V, W). This will damage the drive controller.
• Check the power connections before energizing the drive controller.
• If replacing another drive controller, verify that all wiring connections to the ATV11 drive controller comply with all wiring instructions in this manual.

Failure to follow these instructions can result in death, serious injury, or equipment damage.
• Do not use mineral-impregnated cables. Select motor cabling with low phase-to-phase and phase-to-ground capacitance.
• Motor cables must be at least 20 in. (0.5 m) long.
• Do not run control, power, or motor wiring in the same conduit. Do not run motor wiring from different drive controllers in the same conduit. Separate metallic conduit carrying power wiring from metallic conduit carrying control wiring by at least 3 in. (8 cm). Separate non-metallic conduits or cable trays used to carry power wiring from metallic conduit carrying control wiring by at least 12 in. (31 cm). Always cross power and control wiring at right angles.
• Do not immerse motor cables in water.
• Do not use lightning arrestors or power factor correction capacitors on the output of the drive controller.
• Equip all inductive circuits near the drive controller (such as relays, contactors, and solenoid valves) with electrical noise suppressors, or connect them to a separate circuit.

POWER TERMINALS

You can access the power terminals without opening the cover. The drive controller has through wiring—the line supply is at the top of the drive controller (R/L1–S/L2 in single-phase 230 V; R/L1–S/L2–T/L3 in three-phase 230 V; R/L1–N in single-phase 120 V) and the motor power supply is at the bottom (U–V–W).

*NOTE:* Connect the power terminals before connecting the control terminals.

|    |                                                     | • Impedance: 100 Ω, 50 mA max. |
|    |                                                     | • Sampling time: 20 ms max. |

| LI1 | Programmable logic inputs | • Power supply + 15 V (max. 30 V) |
|     |                           | • Impedance 5 kΩ |
|     |                           | • Positive logic: state 0 if < 5 V, state 1 if > 11 V |
|     |                           | • Negative logic: state 1 if < 5 V, state 0 if > 11 V or switched off (A range only) |
|     |                           | • Sampling time: 20 ms max. |

| +15 V | Logic input power supply | +15 V, ±15% (protected against short circuits and overloads) |
|       |                           | Maximum current available: 100 mA |

Maximum wire gauge: AWG 16 (1.5 mm²)

Maximum tightening torque: 4.4 lb-in (0.5 N•m).
NOTE: The line supply terminals are shown at the top and the motor terminals are shown at the bottom. Connect the power terminals before connecting the control terminals. Install surge suppressors on all inductive circuits located near the drive controller or coupled to the same circuit.

(1) Fault relay contacts for remote indication of drive controller status.

(2) Internal + 15 V. If an external source is used (30 V max.), connect the 0 V of the source to the 0 V terminal, and do not use the + 15 V terminal on the drive controller.

(3) Meter or low level relay.

(4) Refer to the drive controller nameplate for recommended fuses. Fast acting or time delay Class J fuses can be used.
EUROPEAN COMMUNITY EMC DIRECTIVE

The ATV11 controller is considered to be a component. It is neither a machine nor a piece of equipment ready for use in accordance with the European Community EMC directive (machinery directive or electromagnetic compatibility directive). It is the user’s responsibility to ensure that the machine meets these standards.

To meet EN55011 Class A requirements, follow these installation recommendations:

- Ensure that the ground connections of the drive controller, the motor, and the cable shields are at equal potential.
- Use shielded cables with the shields connected to ground at both ends of the motor cable, control cables, and the braking resistor (if used). Conduit can be used for part of the shielding length, provided that there is no break in continuity.
- Ensure maximum separation between the power supply cable (line supply) and the motor cable.

Installation Diagram
The following table describes the parts shown in the installation diagram on page 29.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>EMC mounting plate, ordered separately (catalog number VW3A11831).</td>
</tr>
<tr>
<td>2</td>
<td>ALTIVAR 11 drive controller.</td>
</tr>
<tr>
<td>3</td>
<td>Non-shielded power supply wires or cables.</td>
</tr>
<tr>
<td>4</td>
<td>Non-shielded wires for the output of the safety relay contacts.</td>
</tr>
<tr>
<td>5</td>
<td>The shields for the motor connection and the connection to control devices (items 6 and 7) must be securely attached to the EMC mounting plate. Strip the cables to expose the shields. Apply appropriately sized clamps around the stripped portion of the cables and fasten them to the EMC plate.</td>
</tr>
<tr>

<td>Shielded cable for connection to the motor, with shielding connected to ground at both ends. Do not interrupt the shielding. If using intermediate terminal blocks, they must be in EMC-shielded metal boxes.</td>
</tr>
<tr>
<td>7</td>
<td>Shielded cable for connection to control/command devices. For applications which require a large number of conductors, use small cross-sections (0.5 mm²). Do not interrupt the shielding. If intermediate terminal blocks are used, they must be in EMC-shielded metal boxes.</td>
</tr>
<tr>
<td>8</td>
<td>Ground conductor (cross section 10 mm²).</td>
</tr>
</tbody>
</table>

**NOTE:** If using an additional input filter, mount it on the drive controller and connect it directly to the line supply with an unshielded cable. Then connect the power supply wiring (item 3) to the drive controller using the filter output cable. Although there is an HF equipotential ground connection between the drive controller, the motor, and the cable shielding, you must still connect the PE protective conductors (green-yellow) to the appropriate terminals on each of the devices.

**NOTE:** For very long cable runs, you may need to disconnect the shield at the motor end to alleviate noise generation.
LOGIC INPUT APPLICATION FUNCTIONS

Each of the following functions can be assigned to one of the logic inputs. A single logic input can activate several functions at the same time (reverse and 2nd ramp, for example). You must therefore ensure that these functions are compatible.

2-Wire Control

To select two-wire control, in the FUn menu, set the ACt function of tCC to 2C. The same logic input controls both run (forward or reverse) and stop.

There are three types of 2-wire control:

1. \( tCt = \text{LEL} \): state 0 or 1 is taken into account for run or stop.
2. \( tCt = \text{trn} \): a change of state (transition or edge) must occur to initiate operation, in order to prevent accidental restarts after a power supply interruption.
3. \( tCt = \text{PFO} \): state 0 or 1 is taken into account for run or stop, but the forward input always takes priority over the reverse input.

3-Wire Control

To select three-wire control, in the FUn menu, set the ACt function of tCC to 3C. Run (forward or reverse) and stop are controlled by 2 different logic inputs. LI1 is always assigned to the stop function. A stop on ramp is obtained on opening (state 0). The pulse on the run input is stored until the stop input opens. When the drive controller is powered up, upon a manual fault reset, or after a stop command, the motor can only be supplied with power once the forward and reverse commands have been reset.

Operating Direction (Forward / Reverse)

With 2-wire control, forward operation must be assigned to LI1. It cannot be reassigned to any other logic input. With 3-wire control, forward operation must be assigned to LI2 and cannot be reassigned to any other logic input.

To disable reverse operation for applications with a single direction of motor rotation, do not assign any logic input to reverse operation (in the FUn menu, set rrS to nO).
Preset Speeds

You can assign two or four preset speeds, requiring one or two logic inputs respectively.

Assign LIx to LIA first, then assign Lly to Llb. Consult the following table.

The preset speeds take priority over the reference given by the analog input or by the potentiometer (on A range controllers only).

Fault Reset

A change in state from 0 to 1 of the logic input assigned to fault reset clears the stored fault and resets the drive controller if the cause of the fault is removed. The exceptions are the OCF (overcurrent), SCF (motor short circuit), and InF (internal fault) faults, which require removal of power from the drive controller.

Second Ramp

This function allows switching between the primary (ACC, DEC) and the secondary (AC2, DE2) acceleration and deceleration ramps by activating a logic input assigned to the ramp switching function (rP2).
DO OUTPUT APPLICATION FUNCTIONS

You can use the DO output as an analog output (AO) or a logic output (LO) depending on the function chosen:

**Current in the Motor (AO)**

The full signal corresponds to 200% of the nominal drive current.

**Motor Frequency (AO)**

The full signal corresponds to 100% HSP.

**Frequency Threshold Reached (LO)**

Output energized if the motor frequency exceeds an adjustable threshold.

**Reference Reached (LO)**

Output energized if the motor frequency reaches the reference.

**Current Threshold Reached (LO)**

Output energized if the motor current exceeds the adjustable threshold.

DO Output Wiring Diagram

If a logic output is assigned, Z is an external device such as a low-voltage relay. If an analog output is assigned, Z is an external device such as a meter.
For the resistance of a meter (R), the maximum voltage ($V_Z$) delivered is:

$$V_Z = V_s \times \frac{R(\Omega)}{R(\Omega) + 1000(\Omega)}$$

The voltage source ($V_s$) is the 15 V internal supply or an external source of 30 V maximum.

**Configuration of the Analog Input**

Configure the analog input as one of the following:

- 0–5 V
- 0–10 V
- 0–20 mA
- 4–20 mA

**Wiring Diagram for the Analog Input**
PROGRAMMING

Precautions

⚠️ DANGER

UNINTENDED EQUIPMENT OPERATION

- Before powering up and configuring the drive controller, ensure that the logic inputs are open (state 0) to prevent an accidental startup. Otherwise, an input assigned to the run command may cause the motor to start immediately on exiting the configuration menus.
- Ensure that changes to the current operating settings do not present any danger. Changes must be made with the drive controller stopped.

Failure to follow these instructions will result in death or serious injury.

⚠️ CAUTION

RAPID CONTACTOR CYCLING

- With power switching via a line contactor, avoid operating the contactor frequently. Use inputs LI1 to LI4 to control the drive controller.
- These instructions are vital for cycles of less than five minutes to avoid damaging the precharge resistor and capacitors.

Failure to follow these instructions can result in equipment damage.
Programming the Drive Controller: E (European) and U (North American) Ranges

To save the displayed choice, press \text{ENT}.

Pressing \text{\(\uparrow\)} or \text{\(\downarrow\)} does not save the choice.

The display flashes when a value is stored.

Programming Example

With no fault present and no run command, the normal display is one of the following:

- \text{rdY}: Drive controller ready
- \text{43.0}: Display of the parameter selected in the \text{SUP} menu (default selection: reference frequency)
- \text{dcb}: DC injection braking in progress
- \text{nSt}: Freewheel stop

If there is a fault, the display flashes.
Programming the Drive Controller: A (Asian) Range

- To save the displayed choice, press \( \text{ENT} \).
- Pressing \( \uparrow \) or \( \downarrow \) does not save the choice.
- The display flashes when a value is stored.

With no fault present and no run command, the normal display is one of the following:

- \( \text{rdY} \): Drive controller ready
- \( 43.0 \): Display of the parameter selected in the SUP menu (default selection: reference frequency)
- \( \text{dcb} \): DC injection braking in progress
- \( \text{nSt} \): Freewheel stop

If there is a fault, the display flashes.

⚠️ CAUTION

MOTOR OVERHEATING

- This drive controller does not provide direct thermal protection for the motor.
- Use of a thermal sensor in the motor may be required for protection at all speeds or loading conditions.
- Consult the motor manufacturer for the thermal capability of the motor when operated across the desired speed range.

Failure to follow this instruction can result in injury or equipment damage.
FU

APPLICATION FUNCTIONS MENU

- Type of control (see page 45)
- Reverse (see page 46) (2nd direction of operation)
- Preset speeds (see page 46)
- Fault reset (see page 46)
- Second ramp (see page 48)
- Controlled stop on loss of line supply (see page 48)
- Deceleration ramp adaptation (see page 48)
- Automatic DC injection (see page 49)
- Switching frequency (see page 49)
- Catch on the fly (see page 51)
- Assignment as logic/analog output (see page 51)
- Automatic restart (see page 53)
- Frequency reference mode (Range A only, see page 53)
- Choice of logics for inputs (Range A only, see page 53)
- Motor frequency (see page 55)
- PHF fault configuration (3-phase ratings only, see page 55)
- Configuration backup (see page 55)
- Reset the configuration (see page 55)
Incompatible Application Functions

The following application functions are inaccessible or deactivated as described below:

- Automatic restart is only possible in 2-wire control (ACt in tCC = 2C and tCt in tCC = LEL or PFO). Changing the type of control deactivates the function.
- Catch on the fly is only possible in 2-wire control. Changing the type of control deactivates the function.
  Catch on the fly is inaccessible if continuous automatic DC injection is configured (AdC = Ct). Switching to continuous automatic DC injection (ADC = Ct) deactivates the function.
- For A range controllers, the reverse function is inaccessible if local control is active (ACt in tCC = LOC).

**NOTE:** Multiple functions can be assigned to a single logic input, and function simultaneously. If FWD and REV are assigned to the same logic input, FWD takes precedence.
tCC Menu

Type of control

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>SdC</td>
<td>Injection current, adjustable from 0 to 1.5 In. Accessible only if ACt = YES or Ct.</td>
<td>0.7 In</td>
</tr>
</tbody>
</table>
**Switching frequency**

- **R Fr**: Frequency range
  - L Fr: random frequency around 2 or 4 kHz according to SFr
  - L F: fixed frequency of 2 or 4 kHz according to SFr
  - H F: fixed frequency of 8, 12, or 16 kHz according to SFr

- **S Fr**: Switching frequency:
  - 2: 2 kHz (if ACt = LF or LFr)
  - 4: 4 kHz (if ACt = LF or LFr)
  - 8: 8 kHz (if ACt = HF)
  - 12: 12 kHz (if ACt = HF)
  - 16: 16 kHz (if ACt = HF)

  When SFr = 2 kHz, the frequency automatically changes to 4 kHz at high speed.
  When SFt = HF, the selected frequency automatically changes to the lower frequency if the thermal state of the drive controller is too high. It automatically returns to the SFr frequency as soon as the thermal state permits.

</tbody>
</table>

**NO HOLDING TORQUE**
- DC injection braking does not provide holding torque at zero speed.
- DC injection braking does not function during loss of power or during a drive controller fault.
- When required, use a separate brake for holding torque.

**EXCESSIVE DC INJECTION BRAKING**
- Application of DC injection braking for long periods of time can cause motor overheating and damage.
- Protect the motor from extended periods of DC injection braking.

Failure to follow this instruction can result in death, serious injury, or equipment damage.
FLr and dO Menus

The parameters in unshaded boxes can be modified only when the controller is stopped and locked.
The parameters in shaded boxes can be modified with the controller operating or stopped.

Catch on the fly

</tbody>
</table>

Enables a smooth restart if the run command is maintained after the following events:
- loss of line supply or removal of power
- fault reset or automatic restart
- freewheel stop

The motor resumes from the estimated speed at the time of the restart, then follows the ramp to the reference speed.
This function requires 2-wire control (ACt in tCC = 2C) with tCt in tCC = LEL or PFO.

nO: function inactive
YES: function active

This function intervenes at each run command, resulting in a start after a delay of 1 second maximum.
If continuous automatic injection braking is configured (Ct) this function is inactive.

<td>- YES: Allows automatic restart after locking on a fault, if the fault has been cleared and the other operating conditions permit the restart. A series of automatic restart attempts are separated by increasingly long waiting periods: 1 s, 5 s, and 10 s, then 1 min for the remaining periods. If the restart does not occur after 6 min, the procedure is aborted and the drive controller remains in a fault state until the power is cycled. The following faults permit automatic restart: OHF, OLF, ObF, OSF, and PHF. The drive controller fault relay remains activated if this function is active. The speed reference and the operating direction must be maintained. Automatic restart is only accessible in 2-wire control (ACT in tCC = 2C) with tCt in tCC = LEL or PFO.</td>
<td>nO</td>
</tr>
</tbody>
</table>

**WARNING**

**UNINTENDED EQUIPMENT OPERATION**

- Automatic restart can only be used for machines or installations that present no danger to personnel or equipment in the event of automatic restarting.
- If automatic restart is active, R1 will only indicate a fault after the restart sequence has timed out.
- Equipment operation must conform with national and local safety regulations.

Failure to follow this instruction can result in death, serious injury, or equipment damage.

</tr>
<tr>
<td>FCS</td>
<td>Reset the configuration - nO: function inactive - rEC: resets the configuration to the backup configuration previously saved using SCS. rEC is only visible if a backup has been performed. FCS automatically switches to nO as soon as the reset is complete. - InI: resets the configuration to the factory setting. FCS automatically switches to nO as soon as the reset is complete. NOTE: To perform the rEC and InI commands, you must hold down the ENT key for 2 s.</td>
<td>nO</td>
</tr>
</tbody>
</table>
SUP DISPLAY MENU

When the drive controller is running, it displays the value of one of the monitoring parameters. The default display is frequency reference (parameter FrH).

To change the display, scroll to the desired monitoring parameter and press ENT to display its value. While this value is being displayed, press ENT a second time to confirm the change of the parameter and to store it. From now on, the value of this parameter is displayed while the drive controller is running (even after it has been disconnected). If the new selection is not confirmed in this way, the display returns to the previous parameter after the drive controller is disconnected.
MAINTENANCE AND TROUBLESHOOTING

Precautions

Read the following safety statements before proceeding with any maintenance or troubleshooting procedures.

⚠️ DANGER

HAZARDOUS VOLTAGE

- Read and understand these procedures and the precautions on page 2 of this manual before servicing ATV11 drive controllers.
- Installation, adjustment, and maintenance of these drive controllers must be performed by qualified personnel.

Failure to follow this instruction will result in death or serious injury.

The maintenance and troubleshooting procedures in this section are intended for use by qualified electrical maintenance personnel and should not be viewed as sufficient instruction for those who are not otherwise qualified to operate, service, or maintain the equipment.

Routine Maintenance

Perform the following steps at regular intervals:

- Check the condition and tightness of the connections.
- Make sure that the ventilation is effective and that the temperature around the drive controller remains at an acceptable level.
- Remove dust and debris from the drive controller, if necessary.

Fault Detection

If a fault is detected, the drive controller trips and the fault relay deenergizes unless Atr is active. See parameter Atr on page 53 for a description of automatic restart. See Table 22 on page 60 for fault descriptions. All faults can be reset by cycling the power to the drive controller.

When taking corrective action, verify that there is no voltage present on the DC bus (see the bus voltage measurement procedure on page 22), then check the supply voltage and peripheral equipment as outlined below.
Procedure 1: Checking the Supply Voltage

To measure the input line voltage:

1. Remove all input line voltage.
2. Attach meter leads to L1 and L2. Set the voltmeter to the 600 Vac scale.
3. Reapply power and check for the correct line voltage, according to the drive controller nameplate rating.
4. Remove power. If the controller is wired for three phase, repeat the procedure for L2 and L3, and L1 and L3.
5. When all phases have been measured, remove power. Remove leads and reinstall covers.

Procedure 2: Checking the Peripheral Equipment

Check the equipment for the following conditions. Follow the manufacturer’s procedures.

1. A protective device such as fuses or a circuit breaker may have tripped.
2. A switching device such as a contactor may not be closing at the correct time.
3. Conductors may require repair or replacement.
4. Connection cables to the motor or to ground may be loose. Follow NEMA standard procedure WC-53.

   NOTE: Bus voltage can exceed 400 Vdc. Use appropriately-rated measuring equipment.

5. The motor insulation may be worn. Follow NEMA standard procedure MG-1. Do not apply high voltage to U, V, or W (see Table 9 on page 25). Do not connect high potential dielectric test equipment or an insulation resistance tester to the drive controller, since the test voltages used may damage it. Always disconnect the drive controller from the conductors or motor while performing such tests.
**FAULT STORAGE**

An existing fault is saved and displayed on the keypad display as long as power is maintained. When the drive controller trips, the fault relay deenergizes. To reset the fault:

- Remove power from the drive controller.
- Identify and correct the cause of the fault.
- Restore power. This resets the fault if it has been corrected.

In certain cases, if automatic restart is enabled, the drive controller automatically restarts after the cause of the fault is removed. Refer to the description of Atr on page 53.

---

**CAUTION**

DIELECTRIC TESTS, WHEN CONNECTED

- Do not perform high potential dielectric tests on circuits while the circuits are connected to the drive controller.
- Any circuit requiring high potential dielectric tests must be disconnected from the drive controller before performing the test.

Failure to follow this instruction can result in injury or equipment damage.
LIST OF FAULTS AND CORRECTIVE ACTION

Faults cannot be reset until the cause is removed. Faults OHF, OLF, OSF, ObF, and PHF can be reset via a logic input (rSF) if configured for this function. Faults OHF, OLF, OSF, ObF, and PHF can be reset via automatic restart (Atr) if configured for this function and if the drive controller is configured for 2-wire control. Fault USF resets as soon as the fault is removed; neither a logic input nor automatic restart is required for the reset. All faults can be reset by cycling the power.

Table 22: List of Faults

<td>input phase failure</td>
<td>- input phase loss, blown fuse</td>
</tr>
</tbody>
</table>

- Increase the deceleration time. 
- Install a braking resistor if necessary. 
- Activate the brA function if it is compatible with the application. 
- Increase acceleration time. 
- Ensure that the size of the motor and drive controller is sufficient for the load. 
- Clear mechanical blockage. 
- Check the motor load, the drive controller ventilation, and the environment. Wait for the controller to cool before restarting. 
- Increase ACC for high inertia loads. 
- Check the setting of the motor thermal protection (ItH). See page 39. Check the motor load. Wait for the motor to cool before restarting. 
- Check the line voltage. Compare with the drive controller nameplate ratings. 
- Reset the drive controller. 
- Verify that the wiring is correct (see pages 22–28). 
- Verify that the input power is correct. 
- Check the line fuses. 
- Verify input power connections. 
- Supply 3-phase power if needed. 
- Disable IPL (set to nO).

<td></td>
<td>- transient voltage dip</td>
<td>- Check the setting of parameter UnS.</td>
</tr>
<tr>
<td></td>
<td>- damaged precharge resistor</td>
<td>- Replace the drive controller.</td>
</tr>
</tbody>
</table>

Drive Controller Does Not Start, No Fault Displayed

On power-up, a manual fault reset, or after a stop command, the motor can be powered only after the forward and reverse commands are reset (unless tCt = LEL or PFO). If they have not been reset, the drive controller displays “rdY” or NST, but does not start. If the automatic restart function is configured (parameter Atr in the drC menu) and the drive controller is in 2-wire control, these commands are taken into account without a reset.
