Peltier-Type Chiller

Thermo-con Air-cooled Water-cooled Series HEC

Can precisely control the temperature of a heat source or process fluid.

Precisely control the temperature of the circulating fluid by using the Peltier device. Generates little vibration, and is refrigerant-free and environmentally friendly.

Can control the temperature of the heat source by using the external temperature sensor (sold separately). (Automatically adjusts to the effects of ambient temperature.)

- **Temperature range setting:**
  - 10°C to 60°C

- **Temperature stability:**
  - ±0.01°C to 0.03°C

**Air-cooled Series HEC-A**

- Air-cooled: Can be used in the environments with no cooling equipment.
- Cooling capacity: 230 W, 600 W

**Water-cooled Series HEC-W**

- Water-cooled: Can be used in the environments with facility water equipment.
- Cooling capacity: 140 W, 320 W, 600 W, 1200 W

Compliant with safety standard for medical equipment IEC 60601-1 (Air-cooled/HEC002-A series)

Power supply: Applicable to 100 V to 240 V (Air-cooled/HEC-A series, Water-cooled/HEC001-W, HEC003-W)

Suitable to fluorinated fluids (Fluorinert™ FC-3283, GALDEN® HT135) (Water-cooled/HEC006-W, HEC012-W)

Compatible with ethylene glycol 20% (Water-cooled/HEC001-W, HEC003-W)

Learning Control Function (Temp. control by external temperature sensor)

This function adjusts the fluid temperature to the set value with an automatic offset setting. Set the external temperature sensor at the circulating fluid inlet located just in front of the heat source, which allows the Thermo-con to sample the fluid temperature. This function is effective when automatically adjusting for heat exhaust from piping, etc. If the external temperature sensor is installed directly on the heat source, the learning control function may not work properly due to large heat volume or large temperature difference. Be sure to install the sensor at the circulating fluid inlet.

Principle of Peltier Device (Thermo-module)

A Peltier device (thermo-module) is a plate type element, inside which P-type semiconductors and N-type semiconductors are located alternately. If direct current is supplied to the Peltier device (thermo-module), heat is transferred inside the device, and one face generates heat and increases temperature while the other face absorbs heat and decreases temperature. Therefore, changing the direction of the current supplied to the Peltier device (thermo-module) can achieve heating and cooling operation. This method has a fast response and can shift quickly between heating and cooling, so temperature can be controlled very precisely.
Construction and Principles

- Circulating fluid drain port
- Target of temperature control

The Thermo-con is constructed as shown in Figure 1. It interposes a Peltier device (thermo-module) between the heat exchangers for the circulating fluid and facility water and controls the pulse width of supply direct current to achieve the target outlet temperature of circulating fluid precisely.

The circulating fluid returns to the tank, and is transferred by the pump which is built in the Thermo-con, and goes through the heat exchangers and internal sensors and out from the circulating fluid outlet.

Figure 2 shows an example of circulating fluid piping. The circulating fluid is transferred at a constant temperature by the pump.

*1 Optional setting for the HEC001 and 003
*2 Not built in the HEC001 and 003
*3 Optional setting for the HEC001 and 003 only
When to Use Air-Cooled and Water-Cooled Thermo-con

Both air-cooled and water-cooled Thermo-cons are available. Select a proper Thermo-con by referring to the following.

**Air-cooled**
- No facility water equipment → Can install the unit easily without facility water equipment.
- Frequent piping changes → Can reduce the piping installation labor since facility water piping is not required.

**Water-cooled**
- Need to avoid effects of ambient temperature → Since the unit is water-cooled, the ambient temperature will have little effect.
- Want to reduce the installation space → Can reduce the space since the unit is compact.

Application Examples

**Semiconductor**
- Example: Temperature control of a chamber electrode
  - Upper electrode
  - Lower electrode
  - Etching equipment
  - Spatter equipment
  - Cleaning equipment
  - Coating equipment
  - Dicing equipment
  - Tester, etc.

**Medical**
- Example: Blood preservation
  - X-ray diagnostic instrument
  - MRI
  - Blood preservation equipment

**Machine tool**
- Example: Laser machining
  - Temperature-controlling the laser generating tube enables the laser wavelength to be optimised, improving the accuracy of the machined cross sectional area.
  - Wire cutting
  - Grinder
  - Spot welding
  - Plasma welding
  - Laser machining, etc.

**Analysis**
- Example: Electronic microscope
  - Electron microscope
  - X-ray analytical instrument
  - Gas chromatography
  - Sugar level analytical instrument, etc.

Prevents the distortion caused by the heat generated by the electronic gun in an electronic microscope.

**Bonding of DVD including next generation**

**Cooling of semiconductor laser**

**Temperature control of die-cast mold**

Guide to Model Selection

1. What radiation method will be used?
Without a cooling tower ........ Air-cooled HEC-A series
With a cooling tower .......... Water-cooled HEC-W series

When to Use Air-cooled and Water-cooled Thermo-con
<Air-cooled>
• No facility water equipment → Can install the unit easily without facility water equipment.
• Frequent piping changes → Can reduce the piping installation labor since facility water piping is not required.

<Water-cooled>
• Need to avoid effects of ambient temperature. → Since the unit is water-cooled, the ambient temperature will have little effect.
• Want to reduce installation space. → Can reduce the space since the unit is compact.

2. How much is the temperature in degrees centigrade for the circulating fluid?

Temperature range which can be set with the Thermo-con: 10 to 60°C
If a lower temperature (down to –20°C) or higher temperature (up to 90°C) than this range is necessary, select the Thermo-chiller HRZ series.

3. What kind of the circulating fluids will be used?

Circulating fluids that can be used in the Thermo-con

○ : Usable  × : Unusable

4. How much cooling capacity required?

Allows a safety factor of 20% over the capacity that is actually required, taking into account the changes in the operating conditions. If a larger capacity than this Thermo-con is necessary, select the Thermo-cooler HRG series or Thermo-chiller HRZ series.

Example 1 When the heat generation amount in the customer’s machine is known.

Heat generation amount: 400 W

Cooling capacity = Considering a safety factor of 20%, 400 x 1.2 = 480 W
Guide to Model Selection

Example 2 When the heat generation amount in the customer’s machine is not known.

Obtain the temperature difference between inlet and outlet by circulating the fluid inside the customer’s machine.

\[ Q = \Delta T \times L \times \gamma \times C \]

\[ = \frac{0.8 \times 3 \times 1 \times 10^3 \times 4.2 \times 10^3}{60 \times 1000} \]

\[ = 167 \text{ W} \]

Cooling capacity = Considering a safety factor of 20%,

\[ 167 \times 1.2 = 200 \text{ W} \]

Example 3 When cooling the object below a certain temperature in certain period of time.

\[ Q = \frac{\Delta T \times V \times \gamma \times C}{h \times 60 \times 1000} \]

\[ = \frac{10 \times 20 \times 1 \times 10^3 \times 4.2 \times 10^3}{15 \times 60 \times 1000} \]

\[ = 933 \text{ W} \]

Cooling capacity = Considering a safety factor of 20%,

\[ 933 \times 1.2 = 1120 \text{ W} \]

Precautions on Model Selection

The flow rate of the circulating fluid depends on the pressure loss of the customer’s machine and the length, diameter and resistance created by bends in the circulating fluid piping, etc. Check if the required flow rate of circulating fluid can be obtained before selecting.

### Series HEC-A

### How to Order

**HEC 002 - A 5 B**

- **Cooling capacity:**
  - HEC002-A5A: 230 W
  - HEC006-A5A: 600 W
- **Radiating method:**
  - A: Air-cooled
- **Power supply:**
  - S: 100 to 240 VAC
- **Option:**
  - F: With flow switch
  - N: NPT thread

**Communication**
- Option should be specified when ordering.
  - RS-485
  - RS-232C

</tr>
</tbody>
</table>

**Maintenance**

Maintenance of this unit is performed only in the form of return to and repair at SMC’s site. As a rule, SMC will not conduct on-site maintenance. Separately, the following parts have a limited life and need to be replaced before the life ends.

**Parts Life Expectation**

<table>
<thead>
<tr>
<th>Description</th>
<th>Expected life</th>
<th>Possible failure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pump</td>
<td>3 to 5 years</td>
<td>The bearing is worn so the pump fails to transfer the circulating fluid, which results in temperature control failure.</td>
</tr>
<tr>
<td>Fan</td>
<td>5 to 10 years</td>
<td>The bearing uses up lubrication and makes the fan unable to supply enough air, which deteriorates the cooling and heating capacity.</td>
</tr>
<tr>
<td>DC power supply</td>
<td>5 to 10 years</td>
<td>The capacity of the electrolytic condenser decreases, and causes abnormal voltage which results in DC power supply failure and stops the Thermo-con.</td>
</tr>
<tr>
<td>Display panel</td>
<td>50,000 hours (approx. 5 years)</td>
<td>The display turns off when the backlight of the LCD reaches the end of its life.</td>
</tr>
</tbody>
</table>
**Series HEC-A Options**

**With Flow Switch**

<table>
<thead>
<tr>
<th>Option symbol</th>
<th>Description</th>
<th>Applicable models</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>With Flow Switch</td>
<td>HEC002-A5/-F, HEC006-A5/-F</td>
</tr>
</tbody>
</table>

This is an ON/OFF switch detecting low levels of the circulating fluid. When the fluid volume is 1 L/min. or less, “ERR16” is displayed and the Thermo-con stops. This switch is installed between the circulating fluid inlet and the tank, and built into the Thermo-con. Refer to page 161.

**NPT Thread**

<table>
<thead>
<tr>
<th>Option symbol</th>
<th>Description</th>
<th>Applicable models</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>NPT thread</td>
<td>HEC002-A5/-N, HEC006-A5/-N</td>
</tr>
</tbody>
</table>

The connection parts of circulating fluid piping, facility water piping and circulating fluid drain port are NPT thread type.

**Note** Options have to be selected when ordering the Thermo-con. It is not possible to add them after purchasing the unit.
Series HEC-A
Specific Product Precautions 1
Be sure to read this before handling. Refer to back page 1 for Safety Instructions and back pages 2 to 5 for Temperature Control Equipment Precautions.

System Design

⚠️ Warning

1. This catalog shows the specifications of the Thermo-con.
   1. Check detailed specifications in the separate "Product Specifications", and evaluate the compatibility of the Thermo-con with customer’s system.
   2. Although the protection circuit as a single unit is installed, the customer is requested to carry out the safety design for the whole system.

Handling

⚠️ Warning

1. Thoroughly read the Operation Manual.
   Read the Operation Manual completely before operation, and keep this manual available whenever necessary.
2. If the set temperature is repeatedly changed by 10°C or more, the Thermo-con may fail in short periods of time.

Operating Environment/Storage Environment

⚠️ Warning

1. Keep within the specified ambient temperature and humidity range.
   Also, if the set temperature is too low, condensation may form on the inside of the Thermo-con or the surface of piping even within the specified ambient temperature range. Dew condensation can cause failure, and so must be avoided by considering operating conditions.
2. The Thermo-con is not designed for clean room usage.
   It generates dust from the pump inside the unit and the cooling fan.
3. Low molecular siloxane can damage the contact of the relay.
   Use the Thermo-con in a place free from low molecular siloxane.

Radiation Air

⚠️ Caution

1. The inlet for radiation air must not be exposed to particles and dust as far as possible.
2. Do not let the inlet and outlet for radiation air get closed.

<HEC002>

If radiation is prevented, the set temperature may not be achieved depending on the value of the set temperature and the load. Keep a space of 100 mm for opened rear side or 200 mm for closed rear side respectively.

Note) The space must be 500 mm or more. Be sure that the ambient temperature is within the specification range.
Series HEC-A
Specific Product Precautions 2
Be sure to read this before handling. Refer to back page 1 for Safety Instructions and back pages 2 to 5 for Temperature Control Equipment Precautions.

Caution
3. If more than one Thermo-con is used, consider their arrangement so that the downstream sides of the Thermo-cons suck radiation air from the upstream sides.
   Otherwise, the performance at the downstream sides may deteriorate. Also, the set temperature may not be achieved depending on the value of the set temperature and the load. In such a case, take countermeasures such as changing the direction of circulation or any suitable measures to prevent the deterioration of performance.
4. If dust adheres to the filter, remove dust with a vacuum cleaner or a dry cloth.
5. Do not operate without the filter.
   Otherwise, dust may accumulate on the heat sink and electrical components, causing abnormal heating.

Caution
1. Use tap water or fluid which will not damage the wetted material.
   (Stainless steel 303, Stainless steel 304, EPDM, Polypropylene, PE, PPE, Ceramics, Polyurethane)
2. Deionized water (with an electrical conductivity of approx. 1 µS/cm) can be used, but may lose its electrical conductivity.
   Also, if a facility supplying deionized water is used, the Thermo-con may be damaged by static electricity.
3. If deionized water is used, bacteria and algae may grow in short periods of time.
   If the Thermo-con is operated with bacteria and algae, its cooling capacity or the capacity of the pump may deteriorate. Exchange all deionized water regularly depending on the conditions (once a month as a guide).
4. If using a fluid other than water, please contact SMC beforehand.
5. The maximum operating pressure of circulating fluid circuit is 0.1 MPa.
   If this pressure is exceeded, leakage from the tank in the Thermo-con may result.
6. Select a pipe with a length and diameter which allow a flow rate of 1 L/min or more (HEC002) or 3 L/min or more (HEC006) for the circulating fluid.
   If the flow rate is less than these values, the Thermo-con cannot provide precise control, but also can fail because of the repeated cooling and heating operation.
7. A magnet driven pump is used as a circulating pump.
   A fluid which contains metal powders such as iron powder cannot be used.
8. The Thermo-con must not be operated without circulating fluid.
   The pump can break due to idling.

Circulating Fluid
9. If the tank lid is opened after the supply of circulating fluid, the circulating fluid may spill out depending on the condition of external piping.
10. If an external tank is used, the circulating fluid may spill out from the internal tank lid depending on where the external tank is installed.
   Check that the internal tank has no leakage if using an external tank.
11. If there is a point where fluid is released to atmosphere externally (tank or piping), minimize the piping resistance at the circulating fluid return side.
   If the piping resistance is too large, the piping may be crushed, or the built-in circulator tank may be deformed or cracked because the pressure in the piping for return will become negative. The built-in circulator tank is made of resin (PE).
   Therefore, the tank may be crushed if the pressure is negative. Special attention must be paid if the flow rate of the circulating fluid is high. To avoid getting negative pressure less than –0.02 MPa, the piping for return should be as thick and short as possible to minimize the piping resistance. It is also effective to restrict the flow rate of circulating fluid or remove the gasket of internal tank for the release to atmosphere.
12. Fluorinated fluid is outside of the specifications.
   If it is used in the Thermo-con, static electricity will be generated by the flow of fluid. This static electricity may be discharged to the board of the Thermo-con, causing damage or operation failure and loss of data of such as set temperature. Also, as the specific gravity of the fluorinated fluid is 1.3 to 1.8 times of water, the pump will be overloaded, which also causes fluorinated fluid to be outside the specifications. Therefore, if fluorinated fluid is used, please contact SMC and we will introduce a suitable special product (water-cooled type).
13. Avoid operation with cavitation or bubbles due to low fluid level in the tank. This may shorten the pump life.
14. If clear water is used, it should satisfy the quality standards shown below.

Clear Water (as Circulating Water) Quality Standards
The Japan Refrigeration and Air Conditioning Industry Association
JRA GL-02-1994 “Cooling water system – Circulating type – Supply water”

*1 Electrical conductivity should be 100 [µS/cm] or more.
*2 In the case of [MΩ•cm], it will be 0.003 to 0.01.
Series HEC-A
Specific Product Precautions 3
Be sure to read this before handling. Refer to back page 1 for Safety Instructions and back pages 2 to 5 for Temperature Control Equipment Precautions.

Communication

Caution
1. Prevention of electric shock and fire
   Do not operate the switch with wet hands. Also, do not operate the Thermo-con with water left on it.

2. Action in the case of error
   If any error such as abnormal sounds, smoke, or bad smell occurs, cut off the power at once, and stop supplying and conveying fluid. Please contact SMC or a sales distributor to repair the Thermo-con.

3. Regular inspection
   Check the following items at least once a month. The inspection must be done by an operator who has sufficient knowledge and experience.
   a) Check of displayed contents.
   b) Check of temperature, vibration and abnormal sounds in the body of the Thermo-con.
   c) Check of the voltage and current of the power supply system.
   d) Check for leakage and contamination of the circulating fluid and intrusion of foreign objects to it, and subsequent replacement of the fluid.
   e) Check for flow condition, temperature and filter of radiation air.

Maintenance

Warning
1. The set value can be written to EEPROM, but only up to approx. 1 million times.
   In particular, pay attention to how many of times the writing is performed using the communication function.

  - Thermoelectric device (Thermo-module)

- **Radiating method:**
  - Water-cooled

- **Control method:**
  - Cooling/Heating automatic shift PID control

- **Ambient temperature/humidity:**
  - 10 to 35°C, 35 to 80% RH (no condensation)

- **Circulating fluid** (Note 1):
  - Clear water, Fluorinated fluid (Fluorinert™ FC-3283, GALDEN® HT135)

- **Operating temperature range:**
  - 10.0 to 60.0°C (no condensation)

- **Cooling capacity:**
  - 600 W (Clear water), 400 W (Fluorinert™ FC-3283) (Note 2)
  - 1200 W (Clear water), 800 W (Fluorinert™ FC-3283) (Note 2)

- **Heating capacity:**
  - 500 W (Clear water), 600 W (Fluorinert™ FC-3283) (Note 3)
  - 2200 W (Clear water), 1500 W (Fluorinert™ FC-3283) (Note 3)

- **Temperature stability** (Note 4):
  - ±0.01 to 0.03°C

- **Pump capacity:**
  - Refer to performance chart.

- **Tank capacity:**
  - Approx. 3 L
  - Approx. 5 L

- **Port size:**
  - IN/OUT: Rc3/8
  - Drain: Rc1/4 (with plug)
  - IN/OUT: Rc3/4
  - Drain: Rc1/4 (with plug)

- **Wetted parts material:**
  - Stainless steel 303, Stainless steel 304, EPDM, Ceramics, PPS glass 30%, Carbon, PE, Polyurethane
  - Stainless steel 303, Stainless steel 304, EPDM, Ceramics, PP, PE, Polyurethane, SiC, PPS

- **Temperature range:**
  - 10 to 35°C (no condensation)

- **Pressure range:**
  - 1 MPa or less

- **Required flow rate** (Note 5):
  - 8 to 10 L/min
  - 10 to 15 L/min

- **Port size:**
  - IN/OUT: Rc3/8
  - IN/OUT: Rc1/2

- **Wetted parts material:**
  - Stainless steel 303, Stainless steel 304

- **Power supply:**
  - Single-phase: 200 to 220 VAC ±10%, 50/60 Hz

- **Overcurrent protector:**
  - 10 A
  - 15 A

- **Current consumption:**
  - 5 A
  - 10 A

- **Alarm:**
  - Refer to alarm function.

- **Communications:**
  - RS-485
  - RS-232C

- **Weight:**
  - Approx. 25 kg (including foot for fixing)
  - Approx. 40 kg (including foot for fixing)

- **Accessories:**
  - Power cable, Foot for fixing

- **Safety standards:**
  - CE marking

Series HEC-W

Alarm

This unit is equipped as standard with a function allowing 15 kinds of alarms to display on the LCD and can be read out by serial communication. Also, it can generate relay output for upper/lower temperature limit alarm and output cut-off alarm.

</table>

\(^1\) The HEC012 only
\(^2\) Optional for the HEC001 and HEC003 only (Not available for the HEC006)
\(^3\) Optional for the HEC001 and HEC003

Maintenance

Maintenance of this unit is performed only in the form of return to and repair at SMC’s site. As a rule, SMC will not conduct on-site maintenance. Separately, the following parts have a limited life and need to be replaced before the life ends.

<table>
<thead>
<tr>
<th>Description</th>
<th>Expected life</th>
<th>Possible failure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pump</td>
<td>3 to 5 years</td>
<td>The bearing is worn so the pump fails to transfer the circulating fluid, which results in temperature control failure.</td>
</tr>
<tr>
<td>Fan</td>
<td>5 to 10 years</td>
<td>The bearing uses up lubrication and makes the fan unable to supply enough air, which increases the internal temperature of the Thermo-con, and activates the overheat protection of the power supply and generates the alarm.</td>
</tr>
<tr>
<td>DC power supply</td>
<td>5 to 10 years</td>
<td>The capacity of the electrolytic condenser decreases, and causes abnormal voltage which results in DC power supply failure and stops the Thermo-con.</td>
</tr>
<tr>
<td>Display panel</td>
<td>50,000 hours (approx. 5 years)</td>
<td>The display turns off when the backlight of the LCD reaches the end of its life.</td>
</tr>
</tbody>
</table>
Options have to be selected when ordering the Thermo-con. It is not possible to add them after purchasing the unit.

**With Flow Switch**

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>With Flow Switch</td>
</tr>
</tbody>
</table>

This is an ON/OFF switch detecting low levels of the circulating fluid. When the fluid volume is 1 L/min. or less, "ERR16" is displayed and the Thermo-con stops. This switch is installed between the circulating fluid inlet and the tank, and built into the Thermo-con. Refer to page 161.

**NPT Thread**

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>NPT Thread</td>
</tr>
</tbody>
</table>

The connection parts of circulating fluid piping, facility water piping and circulating fluid drain port are NPT thread type.

**With Level Switch**

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>L</td>
<td>With Level Switch</td>
</tr>
</tbody>
</table>

This switch is used to detect a LOW level of tank fluid. When the fluid level becomes below the LOW level, "ERR20" is displayed and the Thermo-con stops. This switch is installed in the circulating fluid tank and built into the Thermo-con. Refer to page 161.

Series HEC-W

Note) Options have to be selected when ordering the Thermo-con. It is not possible to add them after purchasing the unit.

- **Type**
  - Water cooled
- **Applicable model**
  - HEC001-W5:-F
  - HEC003-W5:-F
  - HEC001-W5:-N
  - HEC003-W5:-N
  - HEC006-W2:-N
  - HEC012-W2:-N

Other models include a level switch as standard equipment.
Series HEC-W
Specific Product Precautions 1
Be sure to read this before handling. Refer to back page 1 for Safety Instructions and back pages 2 to 5 for Temperature Control Equipment Precautions.

⚠️ Warning

System Design

⚠️ Warning
1. This catalog shows the specifications of the Thermo-con.
   1. Check detailed specifications in the separate “Product Specifications”, and evaluate the compatibility of the Thermo-con with customer’s system.
   2. Although the protection circuit as a single unit is installed, the customer is requested to carry out the safety design for the whole system.

Operating Environment/Storage Environment

⚠️ Warning
4. Installation conditions
   If the space for the intake and discharge of air is insufficient, the amount of transferred air will decrease, which can impair the performance and life of the product. Therefore, keep the conditions illustrated below for installation. Also, if ambient temperature is expected to be over 35°C, vent or exhaust air to prevent the increase of ambient temperature over 35°C.

⚠️ Warning

Handling

⚠️ Warning
1. Thoroughly read the Operation Manual.
   Read the Operation Manual completely before operation, and keep this manual available whenever necessary.
2. If the set temperature is repeatedly changed by 10°C or more, the Thermo-con may fail in short periods of time.

Operating Environment/Storage Environment

⚠️ Warning
1. Keep within the specified ambient temperature and humidity range.
   Also, if the set temperature is too low, condensation may form on the inside of the Thermo-con or the surface of piping even within the specified ambient temperature range. Dew condensation can cause failure, and so must be avoided by considering operating conditions.
2. The Thermo-con is not designed for clean room usage.
   The pump and fan generate dust.
3. Low molecular siloxane can damage the contact of the relay.
   Use the Thermo-con in a place free from low molecular siloxane.

⚠️ Caution

Facility Water

1. If the temperature of the facility water is too low, it can cause formation of dew condensation inside the heat exchanger.
   Supply facility water with a temperature over the atmospheric dew point to avoid the formation of dew condensation.
2. If the facility water piping is connected to multiple machines, the facility water exchanges heat at the upstream side and its temperature will become higher as it goes downstream.
   Limit the number of connected Thermo-cons to two per facility water system, and if more than two Thermo-cons are to be connected, increase the number of systems.

Circulating Fluid

⚠️ Caution
1. Use tap water or fluid which will not damage the wetted parts material as described in this catalog’s specifications.
   (PPE, PP glass 10%, Alumina ceramics, Carbon, EPDM, Stainless steel 303, Stainless steel 304, PE, PP, NBR)
2. Deionized water (with an electrical conductivity of approx. 1 µS/cm) can be used, but may lose its electrical conductivity.
Series HEC-W
Specific Product Precautions 2

Be sure to read this before handling. Refer to back page 1 for Safety Instructions and back pages 2 to 5 for Temperature Control Equipment Precautions.

⚠️ Caution

3. If deionized water is used, bacteria and algae may grow in a short period.
   If the Thermo-con is operated with bacteria and algae, its heat exchanging capacity or the capacity of the pump may deteriorate. Exchange all deionized water regularly depending on the conditions (once a month as a guide).

4. If using a fluid other than this catalog, please contact SMC beforehand.

5. The maximum operating pressure of circulating fluid circuit is 0.1 MPa.
   If this pressure is exceeded, leakage from the tank in the Thermo-con can result.

6. Select a pipe with a length and diameter which allow a flow rate of 3 L/min or more for the circulating fluid.
   If the flow rate is less than 3 L/min, the Thermo-con cannot provide precise control, but also can fail because of the repeated cooling and heating operation.

7. A magnet driven pump is used as a circulating pump.
   A fluid which contains metal powders such as iron powder cannot be used.

8. The Thermo-con must not be operated without circulating fluid.
   The pump can break due to idling.

9. If the tank lid is opened after the supply of circulating fluid, the circulating fluid may spill out depending on the condition of external piping.

10. If an external tank is used, the circulating fluid may spill out from the internal tank lid depending on where the external tank is installed.
    Check that the internal tank has no leakage if using an external tank.

11. If there is a point where fluid is released to atmosphere externally (tank or piping), minimize the piping resistance at the circulating fluid return side.
    If the piping resistance is too large, the piping may be crushed, or the built-in circulator tank may be deformed or cracked because the pressure in the piping for return will become negative. The built-in circulator tank is made of resin (PE). Therefore, the tank may be crushed if the pressure is negative. Special attention must be paid if the flow rate of the circulating fluid is high. To avoid getting negative pressure less than -0.02 MPa, the piping for return should be as thick and short as possible to minimize the piping resistance. It is also effective to restrict the flow rate of circulating fluid or remove the gasket of internal tank for the release to atmosphere.

12. If fluorinated fluid is used in the Thermo-con (HEC006/012), static electricity will be generated by the flow of fluid. This static electricity may be discharged to the board of the Thermo-con, causing damage or operation failure and loss of data of such as set temperature.
   Ground pipe in order to remove static electricity.

13. Avoid operation with cavitation or bubbles due to low fluid level in the tank. This may shorten the pump life.

⚠️ Caution

14. If clear water is used, it should satisfy the quality standards shown below.

Clear Water (as Circulating Water) Quality Standards
The Japan Refrigeration and Air Conditioning Industry Association
JRA GL-02-1994 “Cooling water system – Circulating type – Supply water”

+1 Electrical conductivity should be 1000[µS/cm] or more.
+2 In the case of [M•cm], it will be 0.003 to 0.01.

⚠️ Caution

1. The set value can be written to EEPROM, but only up to approx. 1 million times.
   In particular, pay attention to how many of times the writing is performed using the communication function.

⚠️ Warning

1. Prevention of electric shock and fire
   Do not operate the switch with wet hands. Also, do not operate the Thermo-con with water left on it.

2. Action in the case of error
   If any error such as abnormal sounds, smoke, or bad smell occurs, cut off the power at once, and stop supplying and conveying fluid. Please contact SMC or a sales distributor to repair the Thermo-con.

3. Regular inspection
   Check the following items at least once a month. The inspection must be done by an operator who has sufficient knowledge and experience.
   a) Check of displayed contents.
   b) Check of temperature, vibration and abnormal sounds in the body of the Thermo-con.
   c) Check of the voltage and current of the power supply system.
   d) Check for leakage and contamination of the circulating fluid and intrusion of foreign objects to it, and subsequent replacement of water.
   e) Check for leakage, quality change, flow rate and temperature of facility water.
