Presentation

The TSX 37 05 PLC comprises a rack which integrates ~ 100/240 V power supply, a processor including a 11 Kword memory (program, data and constants), 1 Flash EPROM backup memory, a TSX DMZ 28DR discrete I/O module (16 inputs and 12 relay outputs) and an available slot.

The available slot can accept:

- 1 standard format discrete I/O module of any type.
- 2 half format discrete I/O, safety, analog I/O or counter modules.

Description

The TSX 37 05 PLC comprises:

- 1 2-slot rack.
- 2 Centralized display block.
- 3 Terminal port (TER) (Uni-Telway master/slave, Modbus RTU slave protocol or characters string).
- 4 Cover for accessing the power supply terminals.
- 5 Discrete module with 16 inputs and 12 outputs, placed in the first slot (positions 1 and 2). Including screw terminal block.
- 6 Cover for accessing optional battery.
- 7 Available slot.
- 8 Reset button.

Selection

Selection of modules to be inserted in addition to the 16-input/12-output module present at rack no. 1

Type of module to be inserted		Max number of modules		Format		Connection	
		1	2	Standard	Half	Connector	Term.blk
Discrete Inputs/Outputs	8 inputs						
	12 inputs						
	32 inputs						
	4 outputs						
	8 outputs						
	32 outputs						
	16 inputs/outputs						
	28 inputs/outputs						
	64 inputs/outputs						
Preventa safety module							
Analogue I/O	4 or 8 inputs						
	2 or 4 outputs						
	4 inputs and 2 outputs						
Counter/positioning channels	1 incremental code channel						
	2 incremental code channels						
	1 absolute encoder channel						

Possible insertion

### Presentation

The TSX 37 08 PLC comprises a rack which integrates ~ 100/240 V power supply, a processor including a 11 Kword memory (program, data and constants), 1 Flash EPROM backup memory, 2 TSX DMZ 28DR discrete I/O modules (16 inputs and 12 relay outputs) and an available slot.

The available slot can accept:

- 1 standard format discrete I/O module of any type.
- 2 half format discrete I/O, safety, analog I/O or counter modules.

### Description

The TSX 37 08 PLC comprises:

- 1 3-slot rack.
- 2 Centralized display block.
- 3 Terminal port (TER) (Uni-Telway master/slave, Modbus RTU slave protocol or characters string).
- 4 Cover for accessing the power supply terminals.
- 5 Two discrete modules with 16 inputs and 12 outputs, placed in the first and second slot (positions 1 to 4). Including screw terminal block.
- 6 Cover for accessing optional battery.
- 7 Available slot.
- 8 Reset button.

### Selection

Selection of modules to be inserted in addition to the 16-input/12-output module present at rack no. 1

Type of module to be inserted		Max number of modules		Format		Connection	
		1	2	Standard	Half	Connector	Term.blk

	4 outputs						
	8 outputs						
	32 outputs						
	16 inputs/outputs						
	28 inputs/outputs						
Preventa safety module	64 inputs/outputs						
Analog I/O	4 or 8 inputs						
	2 or 4 outputs						
	4 inputs and 2 outputs						
Counter/positioning channels	1 incremental code channel						
	2 incremental code channels						
	1 absolute encoder channel						

Possible insertion

### Presentation

Compact and modular TSX 37 10 PLCs differ in their supply voltage and the type of discrete I/O module fitted in the first slot.

Each TSX 37 10 configuration comprises a rack which integrates a power supply ( $\sim 24$  V or  $\sim 100/240$  V), a processor including a 14 Kword RAM memory (program, data and constants), a Flash EPROM backup memory, a real-time clock, a discrete I/O module (28 or 64 I/O) and an available slot. A TSX RKZ 02 mini extension rack enables the number of slots to be increased by 2 (4 positions).

Each available slot can accept:

- 1 standard format discrete I/O module of any type.
- 2 half format discrete I/O, safety, analog I/O or counter modules.

Also, TSX 37 10 PLCs can connect to the Ethernet network TCP/IP or to a Modem via the TSX ETZ 410/510 external stand-alone module.

### Description

TSX 37 10 PLCs and the TSX RKZ 02 mini extension rack comprise:

- 1 2-slot base rack.
- 2 Centralized display block.
- 3 Terminal port (TER) (Uni-Telway, Modbus RTU master/slave protocol or characters string).
- 4 Cover for accessing the power supply terminals.
- 5 28 or 64 discrete I/O module, placed in the first slot (positions 1 and 2).
- 6 Cover for accessing optional battery.
- 7 Mini extension rack with 2 available slots -(positions 5 to 8).
- 8 LED showing presence of  $\sim 24$  V.
- 9 Power supply terminals protected by removable cover, to connect an auxiliary  $\sim 24$  V power supply if PLCs are supplied with  $\sim 100/240$  V.
- 10 Earth terminal.
- 11 Connectors to the base PLC.
- 12 Reset button.

### Selection

#### TSX 37 10 base PLC selection

Power supply	I/O module integrated in 1 <sup>st</sup> slot				Connection		Reference
	Number of inputs		Number of outputs		HE 10 Connector	Screw terminal block	
$\sim 24$ V	16		12				TSX 37 10 128DT1
	16		12				TSX 37 10 128DTK1
		16		12			TSX 37 10 128DR1
	32		32				TSX 37 10 164DTK1
$\sim 110/240$ V		16		12			TSX 37 10 028AR1
	16			12			TSX 37 10 028DR1

#### Selection of modules to be inserted (3 slots available, that is a maximum of 6 positions)

Type of module to be inserted		Maximum number of modules (1)				Format		Connection	
		1	2	4	6	Stand.	Half	Connect.	Term.blk
Discrete Inputs/Outputs	8 inputs								
	12 inputs								
	32 inputs			(2)					
	4 outputs								
	8 outputs								
	32 outputs			(2)					
	16 inputs/outputs								
	28 inputs/outputs			(2)					
Preventa safety module	64 inputs/outputs		(2)						
		(3)							
AS-Interface bus or I/O extension									
Analog I/O	4 or 8 inputs								
	2 or 4 outputs								
Counter/positioning channels	1 or 2 incremental encoder channels								
	1 absolute encoder channel								
Communication	Ethernet TCP/IP or external Modem					External module			

Possible selection or insertion

(1) With TSX RKZ 02 mini extension rack.

(2) This includes a standard format module to be inserted in the 1<sup>st</sup> slot of the PLC.

(3) The remote discrete I/O extension modules and AS-Interface bus modules are installed in position 4 which means that their use is mutually exclusive.

### Presentation

Modular TSX 37 21/22 PLCs differ in their supply voltage and/or the possibility of fast counting and analogue functions integrated on the base.

Each PLC comprises: a 3-slot rack which integrates a power supply ( $\sim$  24 V or  $\sim$  100/240 V), a processor including a 20 Kword RAM memory (program, data and constants), 1 Flash EPROM backup memory, 2 slots for a PCMCIA card (1 communication card and 1 memory extension card of 128 Kwords maximum) and a real-time clock. A TSX RKZ 02 mini extension rack enables the number of slots to be increased by 2 (4 positions).

Each available slot can accept:

- 1 standard format discrete I/O module.
- 2 half format discrete I/O, safety, analog I/O or counter modules.

Also, TSX 37 21/22 PLCs can connect to the Ethernet network TCP/IP or to a modem via the TSX ETZ 410/510 external stand-alone module.

### Description

TSX 37 21/22 PLCs and the TSX RKZ 02 mini extension rack comprise:

- 1 3-slot base rack (positions 1 to 6).
- 2 Slot reserved for a standard format module.
- 3 Centralized display block.
- 4 Terminal port (TER) (Uni-Telway, Modbus RTU master/slave protocol or characters string).
- 5 Man-machine interface port labeled AUX.
- 6 Cover for accessing the power supply terminals.
- 7 Slot for a PCMCIA memory extension card.
- 8 Slot for a PCMCIA communication card.
- 9 On TSX 37 22, SUB-D connectors type for integrated analogue and counter functions.
- 10 Mini extension rack with 2 available slots (positions 7 to 10).
- 11 LED showing voltage presence of  $\sim$  24 V.
- 12 Power supply terminals protected by removable cover, to connect an auxiliary  $\sim$  24 V power supply if PLCs are supplied with  $\sim$  100/240 V.
- 13 Earth terminal.
- 14 Connectors to the base PLC.
- 15 Reset button.

### Selection

Selection of modules to be inserted (5 slots available, that is a maximum of 9 positions)

Type of module to be inserted		Maximum number of modules (1)					Format		Connection	
		1	3	4	5	9	Stand.	Half	Connect.	Term.blk
Discrete Inputs/ Outputs	8 inputs					(3)				
	12 inputs					(2)				
	32 inputs				(2)					
	4 outputs					(2)				
	8 outputs					(2)				
	32 outputs				(2)					
	16 inputs/outputs					(2)				
	28 inputs/outputs				(2)					
Preventa safety module	64 inputs/outputs		(2)							
	AS-Interface bus or I/O extension	(3)								
Analog I/O	4 or 8 inputs									
	2 or 4 outputs			(4)						
	2 inputs and 4 outputs			(4)						
Counting/ positioning	1 or 2 incremental encoder channels									
	1 absolute encoder channel									
Communication (PCMCIA card on processor)	Serial link									
	CANopen bus									
	Modbus bus									
	Fipio Agent bus									
	Uni-Telway bus									
	Modbus Plus network									
Communication	Fipway network									
	Ethernet TCP/IP or external Modem						External module			

Possible insertion

- (1) With TSX RKZ 02 mini extension rack.
- (2) Comprises a standard format module to be placed in 1<sup>st</sup> slot of the PLC.
- (3) The remote discrete I/O extension modules and AS-interface bus modules are installed in position 4 which means that their use is mutually exclusive.
- (4) With a maximum of 2 (TSX AMZ 600/ASZ 200) modules in the base.

# Modicon TSX Micro automation platform

## TSX 37 05/08/10/21/22 PLCs

1

### Functions

#### Discrete inputs/outputs

The range of in-rack discrete I/O modules offers several possibilities for meeting requirements:

- Cost-effective connection where a 24 V solution is required (mixed I/O modules with HE type 10 connectors for direct connection to pre-actuators in the device using cables with flying leads or direct connection to the TELEFAST2 pre-wired system).
- Connection to the screw terminal block on the front panel of mixed I/O modules.

A set of half format modules enable the PLC configuration to be adapted as closely as possible to the user's requirements in terms of number, range of I/O and type of connection.

*For further details, see pages 2/6 to 2/17.*

The TSX DPZ 10D2A Preventa type safety relay module provides a monitoring function for the emergency stop pushbuttons or limit switches, and is adapted to conform to the safety requirements stipulated in EN 954-1.

*For further details, see pages 2/18 to 2/23.*

#### Remote discrete I/O extension module

TSX 37 10/21/22 Micro PLCs offer two different possibilities for extending the I/O:

- Either with the TSX STZ 10 remote discrete I/O extension module. The discrete I/O of 4 Nano PLCs can be used at a distance of up to 200m (one of which can be a Nano extension PLC).

These Nano PLCs can be used as remote discrete I/O or local slave PLCs.

*For further details, see pages 2/24 et 2/25.*

- The AS-Interface sensor/actuator bus. TSX Micro PLCs are connected to the AS-Interface bus via an AS-Interface master module. In this case, the PLC becomes the master station on the bus and manages a maximum of 248 I/O over a distance of up to 100 m (200 m with a repeater).

*For further details, see pages 4/26 to 4/29.*

- The CANopen machine bus. The communication of the Micro TSX 37 21/22 PLCs enables the connectivity to the CANopen machine bus. It is appeared as a PCMCIA card equipped with a cable (length 0.5m) and a tap junction (with 9-way SUB-D connector). This TSX CPP 110 kit allows the direct linking to the bus and ensures the role of the master on the CANopen bus. The PCMCIA card is inserted into the reserved slot for communication card, available on the TSX 37 21 and TSX 37 22.

*For further details, see pages 4/22 to 4/25.*

#### Analogue I/O and process control

TSX Micro PLCs offer several ways of performing analogue processing:

- For data input or commands which do not need a high resolution level, using I/O integrated in TSX 37 22 PLCs.
- For precise measurement and commands, using TSX AEZ/ASZ/AMZ half format analogue I/O modules.
- To locate analog I/O remotely via the TSX STZ 10 rackmaster module with TSX 37 10/21/22 PLCs. The latter enables the use of three TSX AMN 400 analog extensions, each equipped with 3 analogue inputs and one analog output.

*For further details, see pages 3/5 and 3/6.*

TSX Micro PLCs have, as standard, process control functions which can be accessed by the user via the PL7 Micro, PL7 Junior or PL7 Pro programming software.

*For further details, see pages 3/10 to 3/13.*

### Counting/positioning

Counter modules TSX Micro PLCs offer several ways of counting:

- Using 500 Hz discrete inputs (2 up/down counter channels with upcounting, downcounting or up/down counting functions, with or without detection of direction of operation).
- 10 kHz counter channels integrated into TSX 37 22 PLC bases (2 10 kHz fast counter channels, with 1 channel having down-counting functions as above).
- Counting/positioning TSX CTZ modules ●A, from 40...500 kHz or TSX CTZ 2B, from 200 kHz...1 MHz. These half format modules are inserted in the available slots in the base rack.

For further details, see pages 3/16 to 3/25.

### Communication

TSX Micro PLCs offer several possibilities:

- Integrated communication which offers cost-effective dialogue functions via the terminal port for TSX 37 05/08/10 PLCs or via the terminal and man-machine interface ports for TSX 37 21/22 PLCs. These RS 485 type non-isolated links use Uni-Telway master/slave, Modbus RTU slave or character string. Also TSX 37 10/21/22 PLCs integrate Modbus master protocol.
- PCMCIA format communication card for TSX 37 21/22 PLCs. They have a dedicated slot for the PCMCIA format communication card ("Full-duplex" asynchronous serial link, CANopen bus, Fipio bus, Uni-Telway or Modbus, Modbus Plus or Fipway network).
- Ethernet TCP/IP 10/100 MHz external modules. This external module connects to the terminal port of TSX 37 10/21/22 PLCs and has Uni-TE and Modbus messaging. It also allows connection to an external modem using PPP protocol.

For further details, see pages 4/6 to 4/21.

### Fan modules

TSX FAN ●●P fan modules installed above TSX Micro PLCs ensure a forced air convection, which creates a uniform ambient temperature within the enclosure and eliminates any hot spots which might exist.

Fan modules are required when the ambient temperature is between 60 °C and 70 °C. Forced ventilation is used to eliminate hot spots (1). Three types of fan module are available: --- 24 V, ~ 110 V and ~ 220 V.

One fan module is required for a TSX 37 05/08/10/21/22 configuration, two fan modules are required for a TSX 37 10/21/22 configuration with the TSX RKZ 02 mini rack.

TSX FAN ●●P

TSX 37 05/08/10

TSX 37 10 + TSX RKZ 02

TSX 37 08/21/22

TSX 37 21/22 + TSX RKZ 02

(1) For an ambient temperature of between 25 °C...60 °C, the use of fan modules increases the MBTF.

### Memory structure

The memory structure of TSX Micro PLCs consists of two distinct zones:

- An internal RAM memory designed to receive the application (data, program and constants) of
  - 11 Kwords for TSX 37 05/08 PLCs,
  - 14 Kwords for the TSX 37 10 PLC,
  - 20 Kwords for TSX 37 21/22 PLCs.
- A Flash EPROM memory of:
  - 12 Kwords for TSX 37 05/08 PLCs,
  - 16 Kwords for TSX 37 10/21/22 PLCs
 designed to back up the application program (11 or 14 Kwords maximum) and to back up 1024 %MW internal words in the event of a battery failure or no battery.

For TSX 37 21/22 PLCs, the internal RAM memory can be extended via a 32, 64 or 128 Kwords PCMCIA memory card, either RAM or Flash EPROM. The same memory card incorporated the possibility of contained a storage zone for additional data, e.g. for production data and manufacturing recipes.

### PCMCIA memory extension cards for TSX 37 21/22 PLCs

These cards can be used to extend the PLC internal memory for storing the application program and constants.

Two types of memory card are available:

#### ■ Battery-backed RAM type memory card

Used in particular during application program creation and debugging, this card enables all application transfer and modification services in online mode.

The memory is backed up by a removable battery integrated in the memory card.

#### ■ Flash EPROM type memory card

Used when the debugging of the application program is complete, this card enables one global transfer only of the application and avoids the problems of backup via battery.

A third type of card can also be used to store additional data:

#### ■ Battery-backed RAM type memory card or battery-backed RAM and Flash EPROM

Used particularly in association with the Modem link, these are used to extend the processor's internal memory, and also to store recipe or data log for later consultation via a telephone link.

The RAM memory is backed up by a removable battery integrated in the memory card.

Another type of PCMCIA memory card is available:

#### ■ Backup type memory card (for TSX 37 21/22 PLCs)

Previously loaded with the application program, this card is used to reload the application program into the internal RAM memory and the internal Flash EPROM memory of the processor, without requiring the use of a programming terminal.

### Program loader

The TSX PRG LDR module is designed to simplify duplicating or updating applications on Nano and TSX Micro PLCs without the need for a programming terminal. An application (15 Kwords maximum in internal RAM) can be transferred from a PLC in the TSX PRG LDR module (and saved within it), then transferred from the TSX PRG LDR module to the PLC.

The front panel of the TSX PRG LDR module comprises:

- 1 A cord for connecting to the PLC terminal port.
- 2 Four operation indicator LEDs.
- 3 A W/R button which selects the program transfer direction (PLC → module or module → PLC).
- 4 A GO button to start the transfer.
- 5 A Write Only switch which prevents PLC → module transfer.
- 6 A Program Protect switch which protects the PLC application as read-only after the transfer.

### Application memory

The application memory is divided into memory zones, which are physically shared between the internal RAM memory and the PCMCIA memory card (if the TSX 37 21/22 PLC has a memory card):

- The application data zone which is always is the internal RAM memory.
- The application program zone in the internal RAM memory or on the PCMCIA memory card.
- The constants zone in the internal RAM memory or on the PCMCIA memory card.
- The Flash EPROM zone for the application program backup, the constants and 1 K internal words.
- The file storage zone in the PCMCIA memory card.

If the content of the RAM memory is lost (battery fault or no battery) then the content of the Flash EPROM memory (program, constants and 1 K internal words) is automatically transferred to the internal RAM memory. The backup copy of the application in the Flash EPROM memory requires that the PLC does not have a PCMCIA memory extension card and that the size of the program and the constants does not exceed 16 Kwords.

Two types of application memory organization are possible for TSX Micro PLCs depending on whether the PLC is equipped with a memory extension in the form of a PCMCIA card:

#### Application in the internal RAM

The application is loaded entirely in the battery-backed internal RAM of the processor with a capacity of:

- 11 Kwords for TSX 37 05/08, shared, for example: as 3 Kwords of application data and 8 Kwords of the program and its constants.
- 14 Kwords for TSX 37 10, shared, for example: as 500 words of application data and 13.5 Kwords of the program and its constants.
- 20 Kwords for TSX 37 21/22, shared, for example: as 4 Kwords of application data and 16 Kwords of the program and its constants.

#### Application in the internal Flash EPROM

The total volume is equal to the application volume in RAM, limited to 11 Kwords or 15 Kwords, to which the backup of the first 1024 data words (%MW) is added.

#### Application in the PCMCIA card

The PCMCIA memory card contains the program and the constants. The additional data storage zone for 128 Kword data (available according to the PCMCIA card model) can be used for distributed applications, for storing information which can be consulted remotely via Modem. This zone can also be used for storing manufacturing recipes.

#### Internal RAM data

The data zone can be extended to 20 Kwords, and is only held in the PLC internal RAM.

#### Data backup

The first 1024 words are backed up by the PLC internal Flash EPROM memory. PL7 Micro/Junior/Pro software aids the application designer in the management of the structure and the occupation of memory space for TSX Micro PLCs.

### Application protection

Whatever the PLC's memory structure is: application in internal RAM or on the PCMCIA card, it is possible to protect the structure to prohibit access (reading or program modification) in online mode using PL7 Micro/Junior/Pro software.

### Backup application

Micro TSX 37 21/22 PLCs make it possible to save the 32 Kwords maximum application (programs and constants) on a Backup TSX MFP BAK 032P memory card. The internal RAM memory can thus be reloaded with the contents of this Backup memory card.

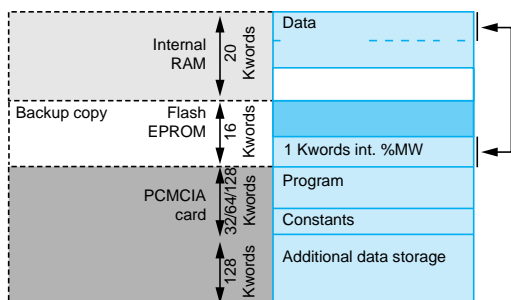

This Backup function is not available if the application runs on a PCMCIA RAM or Flash EPROM memory card.

TSX 37 05/08/10/21/22 (without PCMCIA card)

- 1 Application data (17.5 Kwords maximum).
- 2 Descriptor and executable code for tasks.
- 3 Constant words, initial values and configuration.

TSX 37 21/22 (with a PCMCIA card)

- 1 Application data (17.5 Kwords maximum).
- 2 Descriptor and executable code for tasks.
- 3 Constant words, initial values and configuration.
- 4 According to the PCMCIA card model.

## Centralized display

TSX Micro PLCs are equipped with a display block which groups together centrally all the data required for the control, diagnostics and maintenance of the PLC and all its modules, as well as simple man-machine interface functions.

The centralized display provides:

- Display of the local or remote I/O channel states (I/O of Nano PLCs).
- Display of devices on the AS-Interface bus and AS-Interface bus diagnostics (see page 4/26).
- Display of diagnostics of faulty channels or modules.
- Display of internal data:
  - bits,
  - bit strings,
  - word strings,
  - program variables (active steps, application information, etc).
- 4-digit multiple digital display.

## Description

The centralized display block comprises:

- 1 Three blocks of 32 LEDs representing the slots in which the modules are installed in the base rack or mini extension rack.
- 2 An information line consisting of LEDs which show the display operating modes.
- 3 A command push button which provides access to the various display operating modes.
- 4 Five LEDs:
  - RUN, PLC run/stop,
  - TER, traffic on the terminal port,
  - I/O, I/O fault,
  - ERR, processor or application fault,
  - BAT, battery fault or no battery.

## Characteristics

TSX Micro PLCs have been developed to conform to the national and international standards concerning electronic devices for industrial control systems:

- Specific requirements for programmable controllers: functional characteristics, resistance, robustness, safety, etc. IEC 61131-2, CSA 22-2, UL 508.
- Merchant navy requirements from the main European bodies: BV, DNV, GL, GOST, LR, RRS.
- European directives (low voltage, electromagnetic compatibility), CE marking.
- Electrical qualities and self-extinguishing capacity of insulating materials: UL 746C, UL 94, etc. See page 6/4.

### Environmental characteristics (characteristics common to all TSX Micro PLC components)

<b>Temperature</b>	Operation	°C	0...+ 60 (+ 5...+ 55 conforming to IEC 61131-2), 0...+ 70 with TSX FAN ventilation modules
	Storage	°C	- 25...+ 70 (conforming to IEC 61131-2)
<b>Relative humidity</b>	Operation		10 %...95 %, without condensation
	Storage		5 %...95 % conforming to IEC 61131/2 without condensation
<b>Altitude</b>		m	0...2000
<b>Mechanical withstand</b>	Resistant to vibrations		Conforming to IEC 68-2-6, Fc test
	Resistant to shocks		Conforming to IEC 68-2-27, Ea test
<b>Resistant to electrostatic discharge</b>	Withstand to electrostatic discharge		Conforming to IEC 1000-4-2, level 3 (1)
<b>Resistance to HF interference</b>	Resistant to electromagnetic fields		Conforming to IEC 1000-4-3, level 3 (1)
	Resistant to rapid transient bursts		Conforming to IEC 1000-4-4, level 3 (1)
	Resistant to shock waves		Conforming to IEC 1000-4-5
	Resistant to damped oscillatory waves		Conforming to IEC 1000-4-12
<b>Resistance to LF interference</b>			Conforming to IEC 61131-2

### Power supply characteristics

Type of power supply				Power supply ~	Power supply ≡
<b>Primary</b>	Voltage	Nominal	V	~ 100...240	≡ 24
		Limit (including ripple)	V	~ 90...264	≡ 19.2...30V possible up to 34 V for 1 hr per 24 hrs
	Frequency	Nominal (limit)	Hz	50-60 (47-63)	—
	Current	Nominal input	A	≤ 0.7 (~ 100 V), ≤ 0.3 (~ 240 V)	2
		Inrush (2)	A	≤ 60	≤ 60
	Micro-breaks	Accepted duration		≤ 1/2 period, repetition ≥ 1 s	≤ 10 ms, repetition ≥ 1 s
<b>Secondary</b>	Power	Total useful (typical)	W	24 (32 peak)	16 (18 peak)
	Output currents	≡ 5 V output	A	2.8 (3.2 peak)	2.8 (3.2 peak)
		Output ≡ 24 VR (for relay outputs)	A	0.5 (0.6 peak)	—
		≡ 24 V output sensors	A	0.4 (0.6 peak)	—
	Protection integrated on the outputs against	Overloads		Yes	Yes
		Short-circuits		Yes	Yes
<b>Isolation</b>	Dielectric resistance	Primary/secondary	V rms	2000 - 50/60 Hz	No isolation, 0 V internal connected to the PLC ground

(1) Minimum level in the test conditions defined by the standards.

(2) Values to be taken into account when starting up several devices at the same time or when sizing protection devices.

		Program and constants	Kwords	–		128 with PCMCIA card	
		Data storage	Kwords	–		128	
	Max. data storage size	Internal bits %Mi	bits	256			
		Internal words %MWi	Kwords	1 (6)		1 (6), 17,5 with PCMCIA card	
		Constants words %KWi	Words	128 (6)			
Application structure		Master task	1				
		Fast task	1				
		Event processing	8				
Execution time for 1 instruction	Without PCMCIA card	Boolean	µs	0,25		0,13	
		On word or fixed-point arithmetic	µs	4,81		4,50	
	With PCMCIA card	Boolean	µs	–		0,19	
		On word or fixed-point arithmetic	µs	–		4,50	
No. of K instructions executed by ms	Without PCMCIA card	100 % boolean	Kinst/ms	3,03		5,88	
		65 % boolean and 35 % numerical	Kinst/ms	0,25		0,27	
	With PCMCIA card	100 % boolean	Kinst/ms	–		4,00	
		65 % boolean and 35 % numerical	Kinst/ms	–		0,266	
Overhead système		Master task	ms	1,9		1,6	2,3

(1) The value in bracket and in italics corresponds to number of I/O providing with the basic PLC configuration.

(2) Maximum number of counting/positioning channels, see page 3/16.

(3) TSX CTZ counting/positioning modules, only in the TSX Micro base.

(4) PCMCIA to insert in the communication card slot

(5) The remote discrete I/O extension modules and AS-Interface bus modules are installed in position 4 which means that their use is mutually exclusive.

(6) Default size, can be extended, but will have an adverse effect on the size of the application program.

### Connection principles

#### Connecting modules with screw terminal blocks

The screw connection terminal blocks are fitted with a removable cover ensuring:

- The screws are held in place
- Personnel safety

Each terminal on a screw terminal block can accept bare wires or wires fitted with cable ends, with closed or open tags. The capacity of each terminal is:

- Minimum:
  - 1 wire 0.28 mm<sup>2</sup> (AWG 23) without cable end
- Maximum:
  - 2 wires 1 mm<sup>2</sup> (AWG 17) with cable end, or
  - 1 wire 1.5 mm<sup>2</sup> (AWG 15) without cable end, or
  - 1 open or closed tag for wires of 1 mm<sup>2</sup> (AWG 17).

#### Connecting modules with HE 10 type connectors

##### Prewired cable with 20 flying leads, gauge 22 (0.324 mm<sup>2</sup>)

Used for the simple and direct wire to wire connection of the I/O of modules with connectors 1 to the sensors, preactuators or terminals.

The prewired cable 3 comprises:

At one end, a moulded HE 10 type connector 2 with 20 x 0.34 mm<sup>2</sup> cross-section wires in a sheath.

At the other end 4, flying leads -differentiated by colour coding conforming to DIN 47100.

TSX CDP 301: length 3 m,  
TSX CDP 501: length 5 m,  
TSX CDP 1001: length 10 m.

##### Sheathed rolled ribbon cable, gauge 28 (0.08 mm<sup>2</sup>)

Used to connect the I/O of modules with HE 10 type connectors 1 to Telefast 2 connection and adaption rapid wiring interfaces 2. The cable 3 comprises 2 HE 10 type connectors 4 and a sheathed rolled ribbon cable with 0.08 mm<sup>2</sup> cross-section wires.

Bearing in mind the small cross-section of the wire, this method of connection is only recommended for low current I/O (100 mA maximum per input or per output).

TSX CDP 102: length 1 m,  
TSX CDP 202: length 2 m,  
TSX CDP 302: length 3 m.

##### Connection cable, gauge 22 (0.324 mm<sup>2</sup>)

Used to connect the I/O of modules with HE 10 type connectors 1 to Telefast 2 connection and adaption rapid wiring interfaces 2. The cable 5 comprises 2 moulded HE 10 type connectors 6 and a cable suitable for carrying higher currents (500 mA maximum).

TSX CDP 053: length 0.5 m,  
TSX CDP 103: length 1 m,  
TSX CDP 203: length 2 m,  
TSX CDP 303: length 3 m,  
TSX CDP 503: length 5 m,  
TSX CDP 1003: length 10 m.

### Connection principles (continued)

#### Connection to Tego Dial and Tego Power systems

The TSX DMZ 16 DTK **1** module is also designed for association with Tego Dial and Tego Power (1) systems set up.

In the example the connection is achieved by simply connecting cable TSX CDP ●●3 **2** to the APE-1B24M Dialbase sub-base **3** installed on the Dialpack console **4**, which is fitted with a mounting plate **5** for MMI components.

### Description

#### Discrete I/O modules connected via screw terminal block

Half-format or standard format I/O modules with connection via screw terminal block comprise:

- 1 At rigid metal casing.
- 2 At locking mechanism for fixing the module in its slot. This can only be accessed when the terminal block is removed.
- 3 At removable screw terminal block for connection to sensors and preactuators.
- 4 At cover for the terminal block screws, which also serves as a label holder.

Half-format or standard format I/O module

#### Discrete I/O modules connected via connector

I/O modules with connection via connector comprise:

- 1 At rigid metal casing.
- 2 At locking mechanism for fixing the module in its slot.
- 3 One, two or four HE 10 connectors for connection to sensors and preactuators.

Half-format I/O module

Standard format I/O module

#### Discrete I/O module connected via connector and cage terminal

The TSX DMZ 16DTK module comprises:

- 1 At rigid metal casing.
- 2 At locking mechanism for fixing the module in its slot.
- 3 One HE 10 connector for connection to sensors and preactuators.
- 4 At cage terminal for connecting the input and output power supplies.

(1) See pages 2/44 to 2/3.

Functions

I/O assignment

By software configuration, specific functions can be assigned to certain inputs. The first four inputs of a discrete I/O module located in slot 1 of a TSX Micro PLC can be configured as discrete inputs, latching inputs, event-triggered inputs or up/down counter inputs.

Inputs which can be configured as latching inputs

These are inputs %I1.0 to %I1.3. The principle is that, on a pulse which is shorter than the PLC scan, the pulse is stored and processed on the next PLC scan. The pulse is taken into account when the input changes state (rising and/or falling edge depending on the selected configuration).

Inputs which can be configured as event-triggered inputs

These are inputs %I1.0 to %I1.3. On command events, the application program is diverted directly to the event processing associated with the input causing the event. The event is taken into account when the input changes state (rising and/or falling edge depending on the selected configuration).

Inputs which can be configured as up/down counter inputs

These are inputs %I1.0 to %I1.3. Depending on the software configuration, these inputs enable the creation of up to 2 up/down counter channels, each of which can execute one of the following functions independently: upcounting function, downcounting function, up/down counting with or without direction discrimination.

RUN/STOP command

Input %I1.8 can be set to control the RUN/STOP command on the PLC. This is taken into account on a rising edge. At STOP command via an input has priority over the RUN command via the terminal or network.

Program and data backup input

Input %I1.9 can be set to back up the application program in the Flash EPROM memory (in the internal RAM) and the first 1000 words %MWi maximum on a rising edge.

Alarm output

On a PLC base, output %Q2.0 can, after configuration, be assigned to the ALARM function. When setting the PLC to RUN and if no blocking fault is detected, the alarm output changes to state 1. It can be used in safety circuits external to the PLC, for example to control the output preactuators power supply, or the TSX Micro PLC power supply.

2/3-wire proximity sensor compatibility

Type of sensors	Types of inputs	 24 V Type 1 Positive logic	 24 V Type 2 Positive logic	 24 V Negative logic	 100...120 V Type 2	 200...240 V Type 1
All  3-wire prox. sensors, PNP type

## Use of Preventa safety modules

### Safety

Production workshops and technical building installations are subject to increasing requirements in terms of machine safety

A good machine is a safe machine, combining:

- Safety of personnel (machine is not dangerous).
- Availability of the production tool (machine operational at any time).
- Safety is achieved by:
  - simultaneously optimising safety and availability,
  - using basic principles: redundancy, self-monitoring, etc,
  - considering reliability (failure determining the behavior of the machine in a specified position, positive safety features),
  - ease of maintenance.

### The machinery directive and the work equipment directive

#### The machinery directive

**A machine manufacturer is required to conform to the machinery directive.** The machinery directive (89/392/EEC, 91/36/EEC, 93/44/EEC and 93/68/EEC) is designed to ensure the free circulation of machinery and safety components in European Union countries and to improve the level of safety for personnel.

Harmonised European standards establish technical specifications which comply with the minimum safety requirements defined in the corresponding directive.

Manufacturers must produce machinery which conforms to safety requirements.

#### The work equipment directive

**The user is required to ensure that his range of machines conforms to the use of work equipment by workers at work directive.** Directive 89/655/EEC lays down the minimum objectives for protection in the working environment and in particular concerns the use of products. The directive specifies the general framework of preventative measures which should be taken in the workplace.

### Safety and automated systems

All dangerous areas must be identified and have restricted access, controlled in a secure manner, **ie.** any breakdown or careless operation must leave the automated system in a safe position.

It should be noted that the use of safety products does not necessarily mean that the machine conforms to the machinery directive.

It is the operation, wiring, compatibility and scheme used, which make the entire machine safe. It is more important to think in terms of safety solutions rather than safety products.

### Groupe Schneider, safety specialists

Groupe Schneider, specialists in safety, has a range of several thousand products, all concerned directly or indirectly with safety. Some of these products are exclusively designed for safety.

For further details on components for safety applications, please consult our specialist catalogue.

# Modicon TSX Micro automation platform

## Use of Preventa safety modules

2

2.1

### Non-controlled safety systems

The control signal from the protection device (emergency stop pushbutton illustrated to the left) acts directly on the power contactor of the machine.

In this type of scheme, the risks of simple faults are:

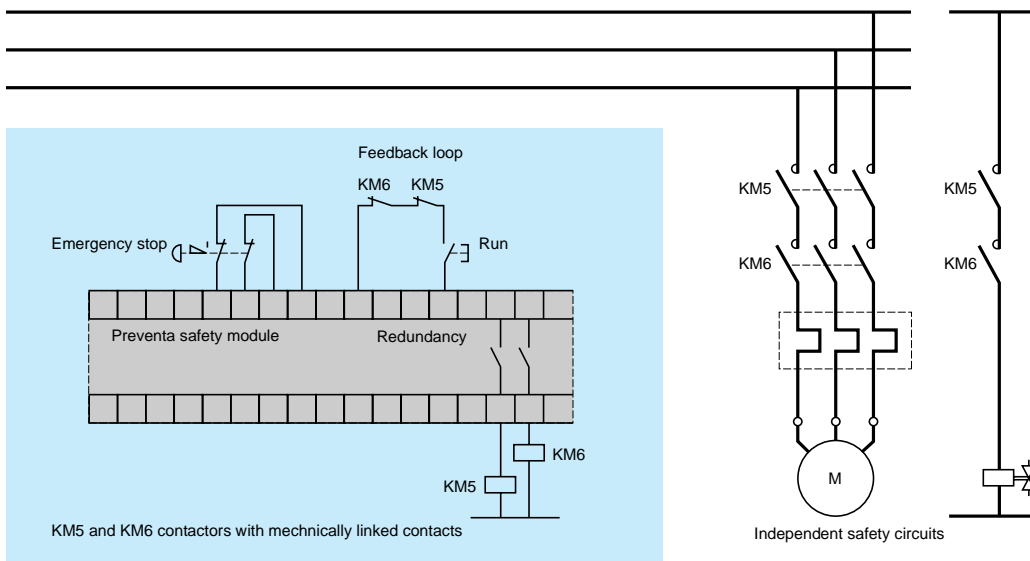

- emergency stop button being shorted.
- KM1 contactor sticking.

When the operator presses an emergency stop button, the instruction is not processed, and another sequence can begin following the emergency stop, despite the presence of the fault.

**In the case of failure, the safety function (1) is compromised.** Therefore, a reliable intermediate relay system must be used.

(1) A safety function is a function whose non-execution or untimely execution results in the immediate placement of the equipment into a non-hazardous position.

### Safety system controlled by a Preventa safety module

Preventa safety modules provide a **reliable** interposing relay function by eliminating the risks of:

- A control circuit fault (inputs).
- A power circuit fault (outputs).
- A fault on an internal safety module component.

**The safety function remains operative whenever any one of these faults occur.**

For the use of mechanically linked contacts CA2-DN22/DN31, LC1-D09/D18/D25, LP1-D09/D18/D25 with contacts which can be used in the feedback loop, please consult your Regional Sales Office.

# Modicon TSX Micro automation platform

## Safety automation system solutions

### Preventa safety module type TSX DPZ

#### Presentation

The TSX DPZ 10D2A Emergency stop monitoring module integrated into the TSX Micro PLC combines:

- The ease of use of Preventa safety modules.
- PLC diagnostics performance.

It also maintains all the advantages of a standard PLC (extended choice of I/O, ease of installation, flexibility of hardware and software developments, etc).

The TSX DPZ 10D2A Emergency stop monitoring module combines a Preventa (XPS) hard-wired safety relay and a discrete acquisition function in a half-slot, for full diagnostics of input contacts and the state of safety circuit outputs.

The TSX DPZ 10D2A safety module is used to interrupt one or more Emergency or safety stop control circuits in complete safety, in accordance with EN 60204-1.

The proven safety of hard-wired technology and the capacity of the TSX Micro PLC make module TSX DPZ 10D2A the optimum solution for making machines more reliable, safer, more compact and more cost-effective.

#### Application developments requiring safety systems and PLC diagnostics

Module TSX DPZ 10D2A is suitable for Emergency stop and limit switch monitoring applications, requiring a level of safety up to category 3 (1) according to EN 954-1 (safety related parts of control systems).

(1) For more information on control system safety categories, please consult our specialist catalogue "Preventa safety solutions".

Solution with safety relay and separate PLC

Simplification using the safety module integrated in the PLC

#### Description

Emergency stop monitoring module TSX DPZ 10D2A comprises:

- 1 A metal casing with a locking system for fixing the module in its slot. This system is only accessible when the screw terminal block is removed.
- 2 A removable screw terminal block for connecting sensors and preactuators.
- 3 A cover giving access to the screw terminal block, which also holds the marker legend.

# Modicon TSX Micro automation platform

## Safety automation system solutions

### Preventa safety module type TSX DPZ

Safety module TSX DPZ 10D2A provides the following functions:

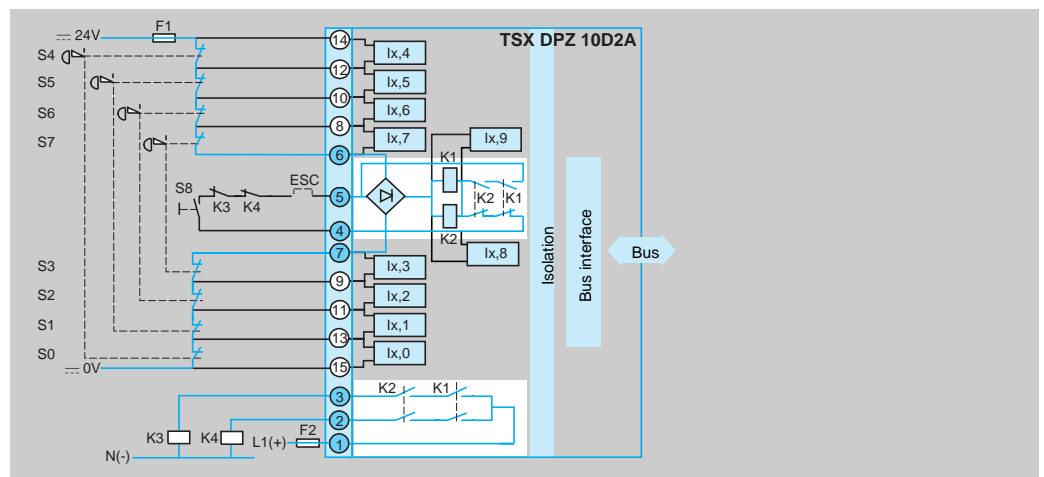

- Monitoring of 1 to 4 dual (or single), N/C (normally closed) contacts in pushbuttons, Emergency stops or limit switches on safety guards for an Emergency stop or immediate safety stop system (category 0 Emergency stop conforming to EN 418).
- Hard-wired safety module identical to Preventa safety module XPS:
  - 2 N/O safety output circuits,
  - category 3.
- Safety module independent of the TSX Micro PLC processor: **the PLC does not affect the safety module.**
- 10 LEDs on the TSX Micro PLC display panel: power supply failure and full diagnostics of the safety system.
- Electronic data acquisition units for full diagnostics of the safety system:
  - reading the state of the 8 pushbutton or limit switch inputs,
  - reading the enable input and the feedback loop,
  - reading the control signal of the 2 safety outputs,
  - monitoring the external power supply for the module.

This electronic data acquisition is designed so that the first failure will not adversely affect the safety function. If the safety system uses more sensors, it is possible to daisy-chain several TSX DPZ 10D2A modules.

#### Schematic diagram

To ensure correct operation of the safety function whatever the first failure, the following must be used :

- At the inputs: Emergency stop pushbuttons or safety limit switches with dual contacts.
- At the outputs: if relaying is required, use relays with guided contacts.
- Module power supply: use an F1 protection fuse (see characteristics on page 2/22).

## Safety automation system solutions

### Preventa safety module type TSX DPZ

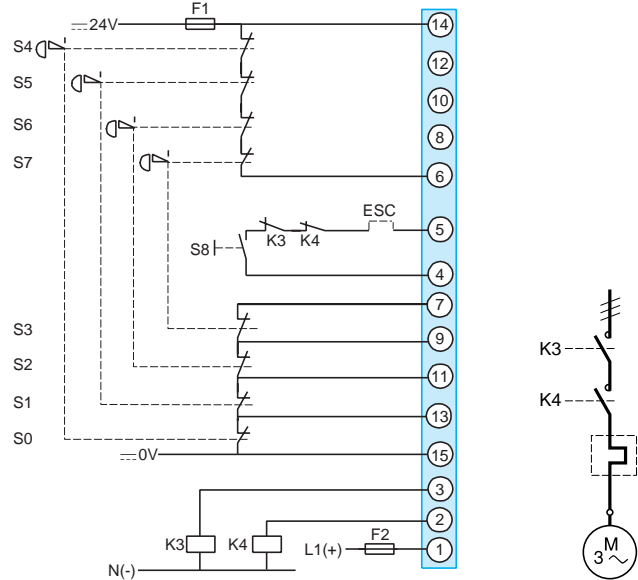

#### Category 3 wiring diagrams (redundant inputs and outputs): recommended applications

##### Connection of 4 sensors with dual contacts

The states of all the contacts in the input circuit are read by the PLC. The consistency test carried out by the PLC program on the input contacts enables it to signal and locate precisely the faulty contact(s). When using less than 4 dual contacts, the input terminals not in use must be linked. For example, if contacts S0 and S4 are not in use, a bridge is required between terminals 14 and 12 and terminals 13 and 15.

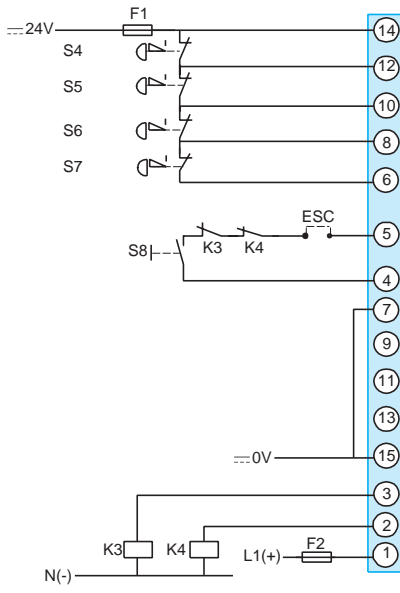

##### Connection of 4 sensors with dual contacts for existing installations

Suitable for use with existing wiring; with one contact on the safety module and one contact for diagnostics, this wiring enables global reading of the state of contacts S4 to S7 and individual reading of contacts S0 to S3. The consistency test carried out by the PLC program on the inputs enables it to signal any inconsistency with partial location of the fault.

#### Wiring diagram with single contacts

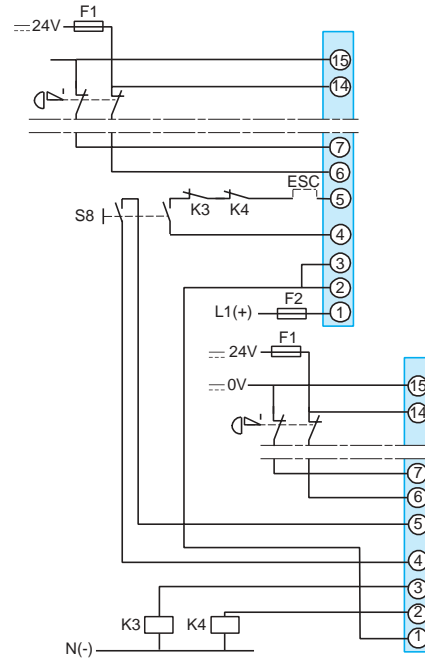

##### Connection of 4 sensors with dual contacts

Not all faults are detected. A short-circuit on a pushbutton or limit switch is not detected. When using less than 4 single contacts, the input terminals not in use must be linked. For example, if contact S5 is not in use, a bridge is required between terminals 10 and 12.

#### Connecting TSX DPZ 10D2A modules in series

##### Connection of 4 sensors with dual contacts for existing installations

The connection of safety relay outputs in series enables diagnostics for up to 32 single or dual contact pushbuttons or limit switches. The number of modules connected in series is limited by the number of slots available on the TSX Micro PLC.

# Modicon TSX Micro automation platform

## TSX STZ extension module for Nano PLCs

### Presentation

The TSX STZ 10 I/O extension module is used to connect up to 4 Nano devices, which may be PLC bases, analogue I/O extensions or a discrete I/O extension. These remotely installed Nano bases or extensions (200 metres maximum from the TSX Micro PLC) can be used as :

- I/O of the Micro PLC. In this case the number of I/O managed by the TSX Micro PLC can be increased by 96 discrete I/O or 12 analogue I/O.
- Local "slave" PLCs (1) with data exchanges from application to application between Micro and each Nano base (the maximum number of Nano bases is limited to 3). In this application, an FTX 117 terminal or PL7 07 software is required for software installation on Nano "slave" PLCs.

It is possible to combine both types of configuration on one link.  
The TSX STZ 10 half-format module is inserted in position 4 which means that its use excludes integration of the TSX SAZ 10 AS-Interface bus master module.

### Remote discrete I/O configuration

Remote discrete or analogue I/O configuration enables :

- A reduction in wiring costs in installations spread over a wide area.
- The I/O status display to be positioned close to the operative part.
- The application to be developed as required by adding I/O blocks.

It is not necessary to configure or program the Nano bases.  
To simplify use of these architectures, the Nano I/O are considered, by the PL7 Micro/Junior/Pro programming software, to be objects integrated in the TSX Micro PLC.

Configuration:  
One to four Nano PLC bases with 10, 16 or 24 I/O, i.e. a maximum of 96 discrete I/O.

### Local "slave" PLC configuration

Apart from the advantages already mentioned, this type of configuration enables each sub-assembly or process block to be handled independently, and only the data necessary for the synchronization and control of sub-assemblies to be handled at the highest level. This structure also ensures better availability in the event of sub-assembly failure or repair.

This configuration enables application data to be exchanged between a TSX Micro PLC and up to three Nano PLCs. This data, set at two read words and two write words per Nano, is exchanged transparently with the Micro master. Slave Nano PLCs are programmed and set up in PL7 language, using an FTX 117 dedicated terminal or PL7 07 software.

### Mixed configuration

It is possible to combine both types of configuration on one link, in which case the maximum number of Nano PLCs is limited to 4.

(1) Cannot be used with Nano extensions.

### Description

The front panel of the TSX STZ 10 I/O extension module for Nano PLCs comprises :

- 1 Locking system for fixing the module in its slot.
- 2 Three indicator lamps to display module operating status :
  - RUN : correct operation of module,
  - ERR : error in module,
  - COM : display of link traffic .
- 3 Opening for cable routing.

Location: position 4 of TSX Micro PLC base.

ABE-7CPA01										
ABE-7CPA11										
ABE-7CPA02										
ABE-7CPA03										

(1) Via splitter sub-base ABE-7ACC02, which allows 16 channels to be split into 2 x 8 channels.

(2) With module TSX CTZ 1A, to be used with sub-bases with no LED.

(3) With module TSX CTZ 2A, to be used with sub-bases with no LED.

(4) The last four channels are not used and remain at 1.

(5) The last four channels are not used.

## Installation system

### Tego Dial for Human-Machine interfaces

## Presentation

The modular Tego Dial system is used to define human-machine interfaces. It facilitates the installation of Ø 22, Ø 16 and Ø 30 mm control and signalling units, DIN format display units, Magelis terminals and display units, XBL keypads and other products.

Tego Dial simplifies an HMI application by :

- definition of the application by Tego Dial Design software,
- quick assembly of dialogue and display units, through the use of modular elements,
- standard connections from the dialogue units to PLCs, bus and other products,
- facilitates the integration of the dialogue application into the machine, control panel, enclosure, machine housing or intermediate suspension arm.

## Description

### ■ Tego Dial Design definition software

This software on CD-ROM facilitates graphical definition of the dialogue application in relation to the control units, pilot lights and display units necessary for the device. It selects the correct Tego Dial components that are required for the application and also features a legend design and printing function, both for the front panel and the connections.

### ■ Dialboard front panels 1

The front panels basically comprise a grey, RAL 7016, painted aluminium frame which is covered by a polycarbonate film.

Six sizes are available based on a modular pattern of height H = 50 mm and width W = 75 mm 2. The sizes are 3H x 4W, 3H x 6W, 6H x 4W, 9H x 2W, 9H x 4W and 9H x 6W.

### ■ Dialpack control console enclosures 3

Four control consoles are available in the following modular sizes : 3H x 4W, 6H x 4W, 9H x 4W and 9H x 6W.

The Dialpack console is an assembly comprising a Dialboard type front panel and a sheet steel folded and welded enclosure, painted with textured grey RAL 7016. The front panel is hinged and can be opened to 120°. Closing is by a 1/4-turn device, with stop, and locking by Ronis key no. 455. Double bar or CNOMO triangular key locks are also available. A customising component in 2 versions - yellow or unpainted - enhances the Dialpack unit and makes it more ergonomic. A Dialpack S version in stainless steel type 304 is available for corrosive environments. This version conforms to enclosure standard EN 50298.

### ■ Plates and cross-pieces 4

A range of modular dimensioned plates facilitates the installation of all combinations of control and signalling units, operator dialogue terminals and other devices. These plates are attached directly to the framework of the front panel.

The plates, made from sheet steel and painted grey RAL 7016, are designed for the following product ranges :

- Ø 22, Ø 16 and Ø 30 control and signalling units,
- DIN format display units,
- Electronic operator terminals and displays (Magelis and others),
- keypads,
- other units : joystick controllers, cam switches, etc.

Cross-pieces aid vertical mounting of several rows of plates.

Cut-outs in the plates are dimensioned to suit the dialogue or display units that are to be installed. Some plate versions for Ø 22 units are available with knock-outs, which need to be removed before mounting the unit. Other versions incorporate cut-outs for the transparent polycarbonate legend holders (included with the plate).

Alternatively, solid plates are also available for mounting any special equipment required.

### ■ Toolkit 5

The installation of dialogue and display units requires cut-outs to be made through the polycarbonate film. To simplify this operation, the plate is marked with cut-out guides and a toolkit is available, comprising : a mallet, cutting tools and replacement blades.

### ■ Pre-assembled kits

Dialboard and Dialpack with pre-assembled plates and cross-pieces are available.

# Modicon TSX Micro automation platform

## Installation system

### Tego Dial for Human-Machine interfaces

#### Standard connections

Tego Dial offers a range of interface components and cabling accessories that simplify connections between control and signalling units and PLCs, buses and other products.

The main components which make up this range are :

- prefabricated connection cables and insulation displacement connectors 1, 5 mm pitch, for connecting control and signalling units to Dialbase interfaces,
- Dialbase 8I/8O or 16I interfaces 2 with integrated commons, for connecting control and signalling units to PLCs via prefabricated Telefast connection cables 5,
- an active splitter block 7 for connecting a Dialbase 8I/8O interface to PLCs with a connection modularity greater than 8I/8O,
- a Dialbase 230 V interface 3 for connecting control and signalling units to any product up to 230V,
- a Dialbase AS-i 4I/4O interface 4 with integrated commons, for connecting control and signalling units to the AS-i bus.

The selection guide on page 2/40 indicates the type and quantity of components (Dialbase interfaces, active splitter block, Telefast connection cables) required to connect the control and signalling units to the various types of PLC. The most efficient connection is achieved using the Dialbase 8I/8O interface and the Telemecanique TSX Micro PLC TSX DMZ16DTK card 6.

2

2.2

#### Dialfix and Dialmove suspension arms

Dialpack control consoles can be fitted directly using 4 adjustable lugs, ref. AE3-FX122. However, for improved ergonomics, they are usually mounted on a suspension arm. This can either be fixed (Dialfix) or moving (Dialmove).

##### Dialfix fixed arms

Two versions are available :

- a straight fixed arm kit, comprising a straight Ø 70 mm tube, 500 or 1000 mm in length, and a pair of clamps (one for each end). Depending on the positioning of the clamps, an inclination of  $\pm 15^\circ$  from the natural position can be achieved,
- an elbowed (90°) fixed arm kit, 500 mm in length. This kit also includes the pair of clamps described above.

##### Arms for corrosive environments

The arms are in 304 type stainless steel and provide 350° rotation on the Dialpack fixing side. Two models are available:

- straight arm kit, length 1000 mm,
- 90° elbowed arm kit, length 500 mm.

##### Dialmove moving arm

This arm enables an extensive choice of mounting configurations. The cabling runs through the elements, which have removable side covers for easy access. Numerous configuration possibilities can be achieved by combining the following components:

- straight tubes (100 to 1000 mm long),
- fixed 90° joint,
- wall fixing bracket (straight or elbowed, fixed or mobile),
- straight fixing plates (one fixed, other rotating) for Dialpack,
- 15° tilted joints,
- pivoting joint (-90° to +90° in the same plane).

## Installation system

### Tego Power for motor power-stater components

#### General presentation

Tego Power is a modular system which standardises and simplifies the implementation of motor power-starters with its prewired control and power circuits. Hence, installation of a motor power-starter is quick, simple, safe and flexible with no wires needed for connection. In addition, this system enables the motor power-starter to be customised at a later date. The system reduces maintenance time and optimises panel space, by reducing the number of terminals, the amount of ducting and intermediate interfaces.

Two solutions are offered :

- A solution using Quickfit technology for TeSys motor power-starter components with spring terminals : model d contactors (9 to 32 A) and the GV2-ME motor circuit-breaker.
- A solution for TeSys motor power-starter components with screw terminals : model d (9 to 18 A) and model k (6 to 12 A) contactors and GV2 motor circuit-breakers.

#### Tego Power Design definition software

This software on CD-ROM enables the motor power-starter application to be graphically defined according to the circuit-breakers and contactors used.

It determines which Tego Power products are required for the application. Referencing labels can also be created for the starters.

#### System for Quickfit technology TeSys motor power-starters with spring terminals

The motor power-starters concerned are those formed by combining :

- GV2-M circuit-breakers,
- with 9 to 32 A model d (LC1) contactors.

Consisting of simple parts, Tego Power Quickfit technology is used to create motor starter assemblies up to 15 kW/400 V.

The main components which make up this range are :

#### For the power circuit

- a **power kit** comprising, for each starter, a plate **1** for mounting the contactor and the circuit-breaker, and the two power connection modules **2**,
- a **power splitter box 5** for 2 or 4 starters,
- an **upstream terminal block 6** for a power supply up to 63 A (16 mm<sup>2</sup>),
- a **downstream terminal block 7** for connecting the motor power supply cables and the earth cables (6 mm<sup>2</sup>).

#### For the control circuit

- a **control splitter box 3** for 2 or 4 starters, with control-command data on HE 10 connector. The data on 4 to 8 starters can be fed back directly to the PLC via an 8I/8O or 16I/8O Telefast cable or to a fieldbus module (AS-i, Fipio, CANopen, DeviceNet, Interbus, Profibus) (see opposite page).
- a **control circuit connection module 4** which plugs directly into the contactor and the circuit-breaker on each starter. This module concentrates the motor starter control-command data. It integrates the circuit-breaker status data in the prewiring of the contactor control circuit.

#### System for TeSys motor power-starters with screw terminals

The motor power-starters concerned are those formed by combining :

- GV2 circuit-breakers (mainly GV2-ME and GV2 P),
- with 6 to 12 A model k contactors (LC1, LP1, LC2, LP2, LP4, LP5) and 9 to 18 A model d contactors (LC1).

The main components which make up this range are :

- **modular sub-bases 1** for 2 or 4 direct or reversing contactors, consisting of a prefabricated power busbar system and a control-command circuit. These sub-bases can be combined to form a variable configuration of 2, 4, 6 or 8 direct starters.
- the **sub-base interconnection kit** to interconnect the control and power circuits on two sub-bases.
- **connection blocks 2 and 3** which perform the following three functions :
  - ensure the mechanical fixing of the motor starter to the modular sub-base,
  - connect the power terminals of the contactor and circuit-breaker,
  - connect the auxiliary contact and A1-A2 coil terminals to the modular sub-base.

# Modicon TSX Micro automation platform

## Installation system

### Tego Power for motor power-starter components

#### Communication modules

##### General

Communication modules are used to send I/O data from a Tego Power motor power-starter configuration to the PLC.

The communication modules is selected according to the type of connection required :

- in parallel mode (modules, terminal blocks or HE 10),
- or in serial mode on the bus (AS-i bus, Interbus S, Fipio, Profibus DP, CANopen or DeviceNet modules).

The communication modules are the same, whether the TeSys motor power-starter system uses spring or screw terminals.

##### Modules in a TeSys motor power-system with spring terminals

Motor power-starters can be connected to a PLC or a bus in two ways :

- by direct connection from the control circuit splitter box 3 with 4 starters, with an HE 10 connector (8I/8O) or two HE 10 connectors (16 I and 8 O),
- by a Tego Power module 1 using an APP-2CX adaptor plate 2.

##### Modules in a TeSys motor power-starter system with screw terminals

A module 4 is mounted by direct mechanical assembly on the modular sub-base , with no screws or accessories.

The electrical connection between the modular sub-base and the communication module is made using an HE 10 connector.

## Power supplies for d.c. control circuits

2

2.3

### ABL-7 power supplies

The ABL-7 range of power supplies is designed to provide the d.c. voltage necessary for the control circuits of automation system equipment. Split into three families, this range meets all the needs encountered in industrial, commercial and residential applications. Single-phase or 3-phase, of the electronic switch mode type, they provide a quality of output which is suitable for the loads supplied and compatible with the mains supply available in the equipment. Clear guidelines are given for selecting protection devices which are often used with them and thus a comprehensive solution is provided, which can be used in total safety.

### Phaseo switch mode power supplies

These switch mode power supplies are totally electronic and regulated. The use of electronics makes it possible to significantly improve the performance of these power supplies, which offer:

- very compact size,
- integrated overload, short-circuit, overvoltage and undervoltage protection,
- a very wide range of permissible input voltages, without any adjustment,
- a high degree of output voltage stability,
- good performance,
- LED indicators on the front panel.

Phaseo power supplies are available in single-phase and 3-phase versions. They deliver a voltage which is precise to 3%, whatever the load and whatever the type of mains supply, within a range of 85 to 264 V for single-phase, or 360 to 550 V for 3-phase. Conforming to IEC standards and UL and CSA certified, they are suitable for universal use. The inclusion of overload and short-circuit protection makes downstream protection unnecessary if discrimination is not required.

ABL-7 RE and ABL-7 RP supplies are also equipped with an output undervoltage control which causes the product to trip if the output voltage drops below 19 V, in order to ensure that the voltage delivered is always usable by the actuators being supplied. All the products are fitted with an output voltage adjustment potentiometer in order to be able to compensate for any line voltage drops in installations with long cable runs. Most of our power supplies are designed for direct mounting on 35 and 75 mm  $\text{U}_\text{L}$  rails.

These power supplies are available in single-phase and 3-phase versions and are split into three families:

#### Compact single-phase supply ABL-7CEM:

- power less than or equal to 30 W (1.2 A),
- compact size,
- for all low power equipment,
- suitable for use in automation system environments based on the Nano and Twido platforms, or in any automation system configuration requiring a  $\text{---}$  24 V supply.

#### Universal single-phase supplies ABL-7RE and ABL-7RP:

- **ABL-7RE**
  - power between 48 W (2 A) and 240 W (10 A),
  - compact size,
  - for all machine equipment,
  - suitable for use in automation system environments based on the Micro and Premium platforms, or in any automation system configuration requiring a  $\text{---}$  24 V supply.
- **ABL-7RP**
  - power between 60 W (2.5 A) and 240 W (10 A),
  - output voltage available:  $\text{---}$  12, 24 and 48 V,
  - input filter (PFC) for commercial and residential environments (conforming to standard EN 61000-3-2),
  - two operating modes possible for handling of overload and short-circuit faults:
    - "AUTO" mode which provides automatic restarting of the power supply on elimination of the fault,
    - "MANU" mode which requires manual resetting of the power supply to restart. Resetting is achieved by switching off the mains power.

ABL 7CEM

ABL-7RP

# Modicon TSX Micro automation platform

## Power supplies for d.c. control circuits

ABL-7UPS

ABL-7REQ

### Phaseo switch mode power supplies (continued)

#### 3-phase and single-phase process supplies ABL-7U and ABL-7REQ:

##### ■ ABL-7UE

- power between 120 W (5 A) and 480 W (20 A),
- compact size,
- voltages between 3 x 380 V and 3 x 500 V,
- for use in industrial applications, for all in-line or continuous process equipment, machine tools and injection presses, etc.
- suitable for use in automation system environments based on the Premium and Quantum platforms, or in any automation system configuration requiring a  $\text{---}$  24 V supply.

##### ■ ABL-7UPS

- power between 120 W (10 A) and 960 W (40 A).
- Identical to the **ABL-7UE** range, this power supply differs in that it includes a filter (PFC) which means that it can be connected directly to the public mains supply, in compliance with standard EN 61000-3-2. This product, for world-wide use, is UL certified.

##### ■ ABL-7 REQ

- power between 120 W (5 A) and 240 W (10 A),
- compact size,
- can be connected to **2-phase** input voltages between 380 V and 415 V, to replace older power supplies connected by only two wires. Economical, more competitive, yet with a smaller input voltage range it can, in certain cases, be used in place of the 3-phase versions.

### Using $\text{---}$ 24 V

■ Using  $\text{---}$  24 V enables so-called protection installations (PELV) to be built. Using PELV is a measure designed to protect people from direct and indirect contact. Measures relating to these installations are defined in publication NF C 12-201 and in standard IEC 364-4-41.

■ The application of these measures to the electrical equipment in machines is defined in standard NF EN 60204-1 and requires:

- that the voltage used is below 60 V d.c. in dry environments and below 30 V in damp environments,
- the connection of one side of the PELV circuit, or one point of the source, to the equipotential protection circuit associated with higher voltages,
- the use of switchgear and control gear on which measures have been taken to ensure "safety separation" between power circuits and control circuits.

■ A safety separation is necessary between power circuits and control circuits in PELV circuits. Its aim is to prevent the appearance of dangerous voltages in  $\text{---}$  24 V safety circuits.

■ The reference standards involved are:

- IEC 61558-2-6 and EN 61558-2-6 (safety transformers),
- IEC 664 (coordination of isolation).

Telemecanique power supplies meet these requirements.

■ Moreover, to ensure that these products will operate correctly in relation to the demands of their reinforced isolation, it is recommended that they be mounted and wired as indicated below:

- they should be placed on an earthed mounting plate or rail,
- they should be connected using flexible cables, with a maximum of two wires per connection, and tightened to the nominal torque,
- conductors of the correct insulation class must be used.

■ If the d.c. circuit is not connected to an equipotential protection conductor, an earth leakage detector will indicate any accidental earth faults (please consult your Regional Sales Office).

### Operating voltage

■ The permissible tolerances for the operating voltage are listed in publications IEC 1131-2 and DIN 19240.

■ For nominal voltage  $U_n = \text{---}$  24 V, the extreme operating values are from - 15 % to + 20 % of  $U_n$ , whatever the supply fluctuations in the range -10 % to + 6 % (defined by standard IEC 38) and load variations in the range 0-100 % of  $I_n$ . All Telemecanique  $\text{---}$  24 V power supplies are designed to provide a voltage within this range.

■ It may be necessary to use a voltage measurement relay to detect when the normal voltage limits are being surpassed and to deal with the consequences of this (please consult your Regional Sales Office).

# Modicon TSX Micro automation platform

## Power supplies for d.c. control circuits

### Selection of power supplies

The characteristics to be taken into account when selecting a power supply are:

- the required output voltage and current,
- the mains voltage available in the installation.

An initial selection can be made using the table opposite.

This may however result in several products being selected as suitable.

Other selection criteria must therefore be taken into account.

#### ■ The quality of the mains power supply

The Phaseo range is the solution because it guarantees precision to 3% of the output voltage, whatever the load current and the input voltage. In addition, the wide input voltage range of Phaseo power supplies allows them to be connected to all mains supplies within the nominal range, without any adjustment.

The Phaseo RP family can also be connected to  $\approx$  110 and 220 V emergency supplies.

#### ■ Harmonic pollution (power factor)

The current drawn by a power supply is not sinusoidal. This leads to the existence of harmonic currents which pollute the mains supply. European standard EN 61000-3-2 limits the harmonic currents produced by power supplies. This standard covers all devices between 75 W and 1000 W, drawing up to 16 A per phase, and connected directly to the public mains power supply. Devices connected downstream of a private, low voltage general transformer are therefore excluded.

Regulated switch mode supplies always produce harmonic currents; a filter circuit (Power Factor Correction or PFC) must therefore be added to comply with standard EN 61000-3-2.

Phaseo ABL-7RP and ABL-7UPS power supplies conform to standard EN 61000-3-2 and can therefore be connected directly to public mains power supplies.

#### ■ Electromagnetic compatibility

Levels of conducted and radiated emissions are defined in standards EN 55011 and EN 55022.

The majority of products in the Phaseo range have class B certification and can be used without any restrictions due to their low emissions.

ABL-7CEM24003 and ABL-7CEM24006 power supplies have class A certification. It is recommended that they should not be used in the following equipment: trains, aircraft, nuclear applications and in any environment where malfunctioning could cause serious injuries or lead to death. These products are designed for use in industrial equipment and are not suitable for use in residential environments.

#### ■ Behaviour in the event of short-circuits

Phaseo power supplies are equipped with an electronic protection device. This protection device resets itself automatically on elimination of the fault (around 1 second for ABL-7 RE/RP, around 3 seconds for ABL-7 UE/UP/REQ) which avoids having to take any action or change a fuse. In addition, the Phaseo ABL-7RP/U/REQ ranges allow the user to select the reset mode in the event of a fault:

- in the "AUTO" position, resetting is automatic,
- in the "MANU" position, resetting occurs after elimination of the fault and after switching the mains power off and back on.

This feature allows Phaseo ABL-7RP/U/REQ power supplies to be used in installations where the risks associated with untimely restarting are significant.

#### ■ Behaviour in the event of phase failure

In the event of failure of one phase, all Phaseo 3-phase power supplies switch to relaxation mode for as long as the input voltage is < 450 V.

For operation on higher voltages (e.g. 480 V), use of an upstream GV2 type residual current protection device is recommended.

#### ■ Selection of reset mode

- on the ABL-7RP family of products:

By microswitch on the front panel of the product.

- on the ABL-7U/REQ family of products:

By jumper on the front panel. **Warning: selection of the function is only possible after the mains power supply has been switched off for at least 5 minutes.** The jumper is moved using a pair of insulated, flat-nose pliers.

2.3

Derating

The ambient temperature is a determining factor which limits the power that an electronic power supply can deliver continuously. If the temperature around the electronic components is too high, their life will be significantly reduced. Conversely, a power supply can deliver more than its nominal power if the ambient temperature remains largely below the rated operating temperature.

The rated ambient temperature for Phaseo power supplies is 50 °C. Above this, derating is necessary up to a maximum temperature of 60 °C.

The graph below shows the power (in relation to the nominal power) which the power supply can deliver continuously, according to the ambient temperature.

- 1 ABL-7RE, ABL-7RP, ABL-7U mounted vertically
- 2 ABL-7CEM mounted vertically
- 3 ABL-7CEM mounted horizontally

Derating should be considered in extreme operating conditions:

- intensive operation (output current permanently close to the nominal current, combined with a high ambient temperature),
- output voltage set above 24 V (to compensate for line voltage drops, for example),
- parallel connection to increase the total power.

General rules to be complied with

Intensive operation	See derating on above graph. Example for ABL-7RE: - without derating, from 0 °C to 50 °C, - derating of nominal current by 2%, per additional °C, up to 60 °C.
Rise in output voltage	The nominal power is fixed. Increasing the output voltage means that the current delivered must be reduced
Parallel connection to increase the power (except ABL-7CEM)	The total power is equal to the sum of the power supplies used, but the maximum ambient temperature for operation is 50 °C. To improve heat dissipation, the power supplies must not be in contact with each other

In all cases, there must be adequate convection round the products to ensure easier cooling. There must be a clear space of 50 mm above and below Phaseo power supplies and of 15 mm at the sides.

## Load limit

ABL-7CEM24●●●

### Presentation

TSX Micro PLCs provide three ways of performing analogue processing:

- With input half format TSX AEZ ●●● modules, and TSX ASZ ●●● analogue outputs modules and TSX AMZ 600 analogue I/O installed in the available slots (base or mini extension rack).
- Or by using the analogue I/O integrated into TSX 37 22 PLC bases.
- Or by using Nano remote analogue I/O extension modules (see pages 2/25 and 2/26).
- The maximum number of analogue modules in a TSX Micro PLC configuration is:
  - 2, for a TSX 37 05/08/10 configuration,
  - 4, for a TSX 37 21/22 configuration (2 TSX ASZ 200/TSX AMZ 600 modules maximum in the base).

These analogue input or output modules are always connected via screw terminal blocks.

### Description

#### TSX AEZ/ASZ/AMZ analogue I/O modules

TSX AEZ/ASZ/AMZ analogue I/O modules comprise:

- 1 Rigid metal casing.
- 2 Locking system for fixing the module in its slot. This system can only be accessed when the screw terminal block is removed.
- 3 Module reference label.
- 4 Connector for fitting screw terminal block.

Connection equipment supplied with each module:

- 5 TSX BLZ H01 removable screw terminal block for connection of analogue sensors and actuators.

### Integrated analogue I/O

Eight 0...10 V inputs and one 0...10 V output are integrated in TSX 37 22 PLC bases. These integrated channels can receive the TSX ACZ 03 adjustment/adaptor module, which enables:

- The use of 4 potentiometers for the user to adjust the 4 application constants (setpoint, threshold, etc.).
- Conversion of 0...10 V inputs to 0...20 mA or 4...20 mA inputs.
- Conversion of 8 0...10 V inputs to 8 0...24 V discrete inputs.

- 1 A 15-pin SUB-D type connector for connecting the analogue sensors/pre-actuators or mounting the TSX ACZ 03 adaptor.
- 2 A 15-way SUB-D type connector for connecting the analogue sensors/preactuators or the discrete sensors.
- 3 Potentiometers for adjusting the first 4 input channels.

### Connection principle for integrated analogue channels using the Telefast 2 pre-wired system

The Telefast 2 pre-wired system facilitates installation of modules by providing access to inputs via screw terminal blocks.

Connection is via a TSX CCP S15 ●●● shielded cable (length 0.5 to 2.5 m) fitted with SUB-D type connectors at each end.

The ABE 7CPA01 wiring connection base is used to connect the following:

- 8 analogue inputs (or 8 0...24 V discrete inputs with TSX ACZ 03 adaptor module).
- 1 analogue output.
- 1 0...10 V reference output for using 4 external potentiometers for the last 4 channels (4.7 kΩ, precision ± 20 % maximum), if required.

# Modicon TSX Micro automation platform

Integrated analogue channels and analogue I/O modules

## Functions

Analogue I/O modules do not require an external power supply: energy is provided via the TSX Micro PLC power supply. For maximum reliability, these modules do not contain any electromechanical components: there are no multiplexing relays, no configuration switches, and no adjustment potentiometers. These modules only contain solid state components, and are configured using PL7 Micro or PL7 Junior or PL7 Pro software.

## TSX AEZ 801/802 analogue input modules

These modules (TSX AEZ 801 and TSX AEZ 802) are analogue input modules, with 8 high level multirange voltage or current channels. For each input, they offer a choice between + 10 V or 0...10 V (TSX AEZ 801) and 0...20 mA or 4...20 mA (TSX AEZ 802) ranges, according to the selection made in the configuration.

The various functions of the TSX AEZ 801/802 analogue input modules are as follows:

- Scanning of input channels used by solid state multiplexing (normal or fast) and acquisition of values.
- Analogue/digital conversion (11 bits + sign or 12 bits) of input signals.

The processing performed by the PLC processor, in addition to these functions:

- Monitoring of input overshoots.
- Filtering measurements.
- Converting input measurements to user format for display in directly readable units.

## TSX AEZ 414 analogue input modules

The TSX AEZ 414 module is an analogue input module with 4 different channels. Depending on the selection made in configuration and for each channel, it provides the thermocouple, temperature probe or high level voltage and current ranges via external resistors supplied with the module (see page 3/7 for the various ranges).

The functions of the TSX AEZ 414 analogue input module are as follows:

- Selection of the input range of each channel.
- Scanning of input channels by multiplexing and acquisition of values.
- Analogue/digital conversion (16 bits) of input signals.
- Monitoring of input value overshoots and sensor connections.
- Automatic linearization for Pt 100 and Ni 1000 temperature probes.
- Automatic linearization and internal or external cold junction compensation for thermocouple ranges.
- Converting input measurements to user format for display in directly readable units (physical units or user range).
- Detection of sensor connection faults for thermocouple ranges.

## TSX ASZ 401/200 analogue output modules

The TSX ASZ 401 module provides 4 common point analogue outputs (+ 10 V or 0...10 V). The TSX ASZ 200 module offers a choice between + 10 V, 0...20 mA and 4...20 mA ranges for both the common point outputs.

The various functions of the TSX ASZ 401/200 analogue output modules are as follows:

- The acceptance of digital values corresponding to analogue values obtained as output. These values are calculated by the PLC task to which the channels are assigned (MAST or FAST).
- Processing dialog faults with the PLC and setting the outputs to fallback state (value 0 or maintained).
- Selection of the range for each output: voltage or current (module TSX ASZ 200).
- Analogue/digital conversion (11 bits + sign) of output values.

# Modicon TSX Micro automation platform

Integrated analogue channels and analogue I/O modules

## TSX AMZ 600 analogue mixed I/O module (1)

TSX AMZ 600 provides 6 common point channels, high level multirange voltage (0...10 V,  $\pm 10$  V)/current (0...20 mA, 4...20 mA) of which:

- 4 input channels.
- 2 output channels.

The 4 input channels guarantee the following functions:

- Scanning of input channels used by solid state multiplexing (normal or fast) and acquisition of values.
- Analogue/digital conversion (11 bits + sign or 12 bits) of input signals.

The processing performed by the PLC processor, in addition to the above functions is:

- Monitoring of input overshoots.
- Filtering measurements.
- Converting input measurements to user format for display in directly readable units.

The 2 output channels guarantee the following functions:

- The acceptance of digital values corresponding to analogue values obtained as output. These values are calculated by the PLC task to which the channels are assigned (MAST or FAST).
- Processing dialog faults with the PLC and setting the outputs to fallback state (value 0 or maintained).
- Selection of the range for each output: voltage or current (module TSX ASZ 200).
- Analogue/digital conversion (11 bits + sign) of output values.

## Integrated analogue channels on TSX 37 22 PLC bases

TSX 37 22 PLCs integrate as standard a high level analogue interface with 8 input channels 0...10 V and one 0...10 V output channel. This interface enables the PLC to meet the requirements of applications which require analogue processing but where the performance criteria and characteristics of an analogue input module cannot be justified.

The various functions of integrated analogue channels are as follows:

- Scanning of input channels by solid state multiplexing (normal or fast) and acquisition of values.
- Analogue/digital conversion (8 bits) and filtering of input measurements.
- Updating the digital output value by the processor.
- Analogue/digital conversion of the output value.
- Processing dialog faults with the PLC and in particular setting the output to fallback state.
- Supplying a reference voltage for potentiometers, either external or included in the TSX ACZ 03 adjustment/adaptor module.

## Remote extension of analogue I/O modules

It is possible to link the TSX STZ 10 I/O extension module (installed in position 4 of the base) to up to 3 high level Nano analogue I/O modules (3 input channels/1 output channel per module).

(1) Requires a PLC with a version  $\geq 5.0$  operating system. Installation of the TSX AMZ 600 involves version  $\geq 4.2$  PL7 Micro/Junior/Pro software.

## Characteristics of I/O modules

Type of input modules			TSX AEZ 801	TSX AEZ 802	TSX AEZ 414

## Presentation

The CCX 17 industrial operator panel displays and controls all the PID controller parameters which can be modified **without having to program the TSX Micro or Premium PLC application program**.

The PID\_MMI man-machine interface function, included in the PL7 Junior software, provides an application program on the CCX 17 industrial operator panel for controlling and adjusting PID loops.

It enables the CCX 17 operator panel to manage:

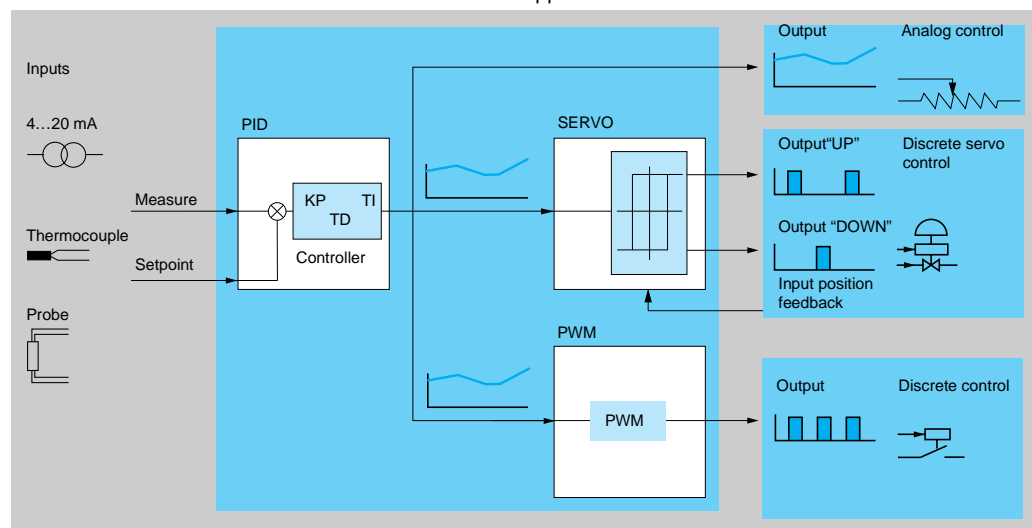

- Selection of a PID loop.
- Display and control of that PID loop.
- Adjustment of the PID loop parameters.

This man-machine interface function is easily installed for any man-machine interface application on the CCX 17 operator panel. The three preconfigured screens enable the required operations to be performed on any PID controller.

## Process control function

The CCX 17 operator panel can manage up to 9 PID controllers. Installation of the man-machine interface function is simple and is performed as follows:

- The PID\_MMI function is activated on each scan of the TSX Micro or Premium PLC (unconditional call-up).
- A single call-up of the PID\_MMI function manages all the PID loops in the TSX Micro or Premium PLC -application.

The **PID** function sets a PID serial/parallel algorithm and works out the control signal on the basis of:

- A measurement sampled by an input module.
- The setpoint value fixed either by the operator or by the program.
- The values of the various controller parameters (KP, TI, TD, sampling period, etc).

The **analogue control** signal from the controller can be processed:

- Either directly by a TSX Micro or Premium PLC analogue output module connected to the actuator.
- Or via the PWM or SERVO adaptations depending on the type of actuator for discrete control.

The **PWM** function provides the required adaptation to control a pulse width modulation actuator via a discrete output.

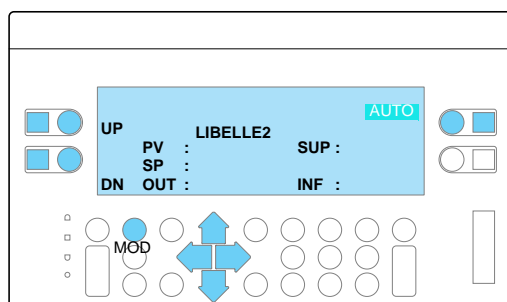

The **SERVO** function provides the required adaptation to control a motorised actuator with "UP/DOWN" control provided by a discrete output. It has a position feedback input to execute servo control.

These two functions are installed in cascade on the PID controller function.

## Control and man-machine interface functions

Process control of semi-continuous processes  
CCX 17 industrial operator panels

## Description

### Front of CCX 17 20 panels

CCX 17 20 industrial operator panels comprise:

- 1 A display screen, back-lit LCD with 2 to 4 lines of 40 characters.
- 2 A keypad divided into 3 zones:
  - system keys,
  - cursor movement keys,
  - numeric keys.
- 3 Four control buttons with identification labels.
- 4 Three signalling lamps activated during self-tests and by the PLC application during operation.

### Front of CCX 17 30 panels

CCX 17 30 industrial operator panels comprise:

- 1 A display screen, back-lit LCD with 4 to 8 lines of 40 characters.
- 2 A keypad divided into 3 zones:
  - system keys,
  - cursor movement keys,
  - numeric keys.
- 3 Eight control buttons with identification labels.
- 4 Three signalling lamps activated during self-tests and by the PLC application during operation

### Underside of CCX 17 20/30 panels

Located on the underside of CCX 17 20/30 industrial operator panels are:

- 1 A removable screw terminal block for the --- 24 V power supply and the alarm relay connector.
- 2 A 26-way high density SUB-D for the Uni-Telway link to PLCs.
- 3 A 3.15 A TD5 X 20 fuse carrier.
- 4 Un emplacement pour pile de sauvegarde.
- Depending on the version:
  - 5 A removable screw terminal block for connecting the discrete solid state outputs of the panel.
  - 6 A 9-way SUB-D 9 connector for connecting to a printer.
  - 7 A PCMCIA card slot for connection to the Fipio bus or storing/retrieving the MMI application.

## Characteristics

(1) Includes the T CCX CB 10 cable as standard (0.2 m long with 2 2x26-way and 25-way SUB-D connectors). Includes a multilingual quick reference guide as standard (English, French, German, Italian and Spanish).

(2) Includes the MMI application archive and retrieval function on a PCMCIA card.

(3) The CCX 17 operator panel connected on a Fipio bus communicates with the bus arbitrator PLC station.

(4) Only compatible with MMI applications on T CCX 1720 ●●● operator panels.

## Dimensions, mounting

### Dimensions

### Flush-mounted

Fixed by 4 or 6 locking clips (supplied) pressure mounted (on panel 1 to 6 mm thick)

Modicon TSX Micro  
automation platform  
Integrated counter channels and  
counter/positioning modules

Applications

Counter channels integrated in TSX Micro PLCs

Number of channels<sup>(1)</sup>

2 independant channels

2 independant channels (not excluding the 2 upcounter channels on the discrete inputs

Frequency per channels

500 Hz (450 Hz for incremental encoderwith phase-shifted signals)

10 kHz

Response time

8 ms (taking account of an event-triggered input and positionning of a discrete module output in master

Counter/measurement inputs

Channels 0 and 1: 4 x  $\pm$  24 V inputs for proximity sensors and mechanical contacts, compatibles with Totem Pôle incremental encoders

Channel 11:  $\pm$  5/24 V for 1 Totem Pole or RS 422 incremental encoders  
Channels 11 and 12 :  $\pm$  24 V inputs for proximity sensors and mechanical contacts

Auxiliary inputs

1 input per channel : preset (using 2<sup>nd</sup> counter input)

1  $\pm$  24 V input per channel: preset

Counting capacity

24 bits + sign (0 to + 16 777 215 points or  $\pm$  16 777 215 points)

Functions

Downcounting with preset input, upcounting with reset input.  
Up/down counting with preset input, configurable counter input:  
- 1 upcounter input/1 downcounter input,  
- 1 up/downcounter input and 1direction input,  
- incremental encoder with phase-shifted signals or proximity sensor.

Processing

Inputs :  
Counter enable, counter present.  
Comparison:  
Downcounting: to value 0. Upcounting: 2 thresholds and 1setpoint. Up/down counting: 2 thresholds.

Events

Events associated with each counter channel, causing activation of the priority event-triggered task

Connection

Via screw terminals (supplied with module)  
Via 20-way HE 10 type connectors

Via 15-way SUB-D connectors  
Via Telefast 2 pre-wired system (ABE 7CPA01)

Type of modules

1 Counter channels on discrete inputs

2 Counter channels integrated in TSX 37 22

Pages

3/16

Presentation

Counter functions are required for counting items or events, grouping objects, controlling input and output flow, measuring the length or position of elements and measuring speed, frequency or duration. TSX Micro PLCs provide 3 ways in which these functions of downcounting, upcounting or up/down counting can be performed: On the inputs of the discrete I/O module located in the first slot of TSX Micro PLCs, or

- Using the counter channels 11 and 12 integrated in TSX 37 22 PLCs, or
- With TSX CTZ counter modules installed in the available slots on TSX Micro PLC bases.

Maximum number of counter channels permitted

Max. no. of channels	4	5	6	7	7	8	7	7	8	7	8	8	8	8	9

Description

Counting (500 Hz) on the inputs of discrete modules

The first 4 inputs of the TSX DEZ/DMZ 28, 32 or 64 discrete I/O module located in slot no. 1 enable two counter channels to be used.

- 1 20-way HE 10 connector (or screw terminal block depending on the model) for connecting:
- Counter sensors or  $\pm$  24 V incremental encoder for channel 0,
  - Counter sensors for channel 1,
  - $\pm$  24 V encoder power supply.

Counter channels (10 kHz) integrated in TSX 37 22 PLCs

TSX 37 22 PLC bases have an integral counter interface (2 channels) which can be accessed via:

- 1 Two 15-way SUB-D connectors for connecting:
- Counter sensors or incremental encoder for -channel 11,
  - Counter sensors for channel 12,
  - Auxiliary preselection input,
  - Power supplies for auxiliary inputs, sensors and incremental encoder.

The second connector can take the Telefast 2 ABE 7CPA01 wiring system to facilitate installation.

TSX CTZ 1A/2A (40 kHz) and TSX CTZ 2AA (500 kHz) counter modules

The TSX CTZ 1A (1 channel) and TSX CTZ 2A/2AA (2 channels) half-format counter modules have on their front panel:

- 1 One high-density 15-way SUB-D connector per channel for connecting:
- counter sensors or incremental encoder,
  - encoder power supply,
  - encoder power supply feedback for checking that this is correctly supplied.
- 2 20-way HE 10 connector for connecting the following to each channel:
- auxiliary inputs: preselection, counter enable and read,
  - power supplies for auxiliary inputs, sensors and -incremental encoder(s).
- 3 Locking system for fixing the module in its slot.

# Modicon TSX Micro automation platform

## Integrated counter channels and counter modules

### Applications

#### Example of upcounting or downcounting

This example shows the grouping of objects supplied by a conveyor belt for packaging.

This simple counting application uses a sensor (proximity sensor, photoelectric sensor) linked to a preset counter. When the preset value is reached the packaging command is activated and the control system initiates a new packaging cycle.

#### Examples of up/down counting

In this example objects are upcounted or downcounted in a tunnel. The system checks that a critical threshold is not crossed in order to detect any malfunction in the tunnel.

This up/down counting application uses two sensors (proximity sensors or photoelectric sensors) linked to a threshold up/down counter. Each input sensor pulse increments the counter, each output sensor pulse decrements it. Crossing the authorised maximum threshold sets off an alarm.

In this example, the length of objects travelling on a conveyor belt is measured in order to sort them.

This up/down counting application follows this sequence: a sensor detects the presence of the object on the conveyor belt. While the object is on the belt, the pulses from the generator linked to the forward movement of the conveyor belt are counted. The number of pulses represents an image of the length of the object. This measurement can then be compared to various minimum and maximum thresholds.

#### Example of up/down counting with processing

In this example the correct operation of a pump is checked by taking account of its rotation speed. This speed should lie between a low threshold (pump fault) and a high threshold (pump cut-out).

The speed of the pump is measured by taking account of the pulses supplied by an incremental encoder (or proximity sensor) during a unit of time (time base worked out by the TSX 37 22 PLC system).

The current value obtained is compared to the two predefined thresholds in order to detect any anomaly.

## TSX CTZ 1B absolute encoder positioning module

### Presentation

The 1 channel TSX CTZ 1B positioning module completes the TSX Micro platform range in the counting and positioning field through the acquisition of information from a SSI series absolute encoder.

This type of module allows for the following and actual positioning of a moving object, including after a loss of power. This characteristic, linked to the absolute encoder is used to simplify the installation of positioning applications. It also simplifies the input interfaces by suppressing homing, adjustment ...

Depending on the model, the TSX Micro PLCs can receive the maximum of:

- TSX 37 05/10, 2 TSX CTZ 1B modules in slots 3 and 4.
- TSX 37 08, 2 TSX CTZ 1B modules in slots 5 and 6.
- TSX 37 21/22, 4 TSX CTZ 1B modules in slots 3, 4, 5 and 6.
- and this within the limit of the number of channels generated by the TSX Micro PLC (see page 3/16).

### Description

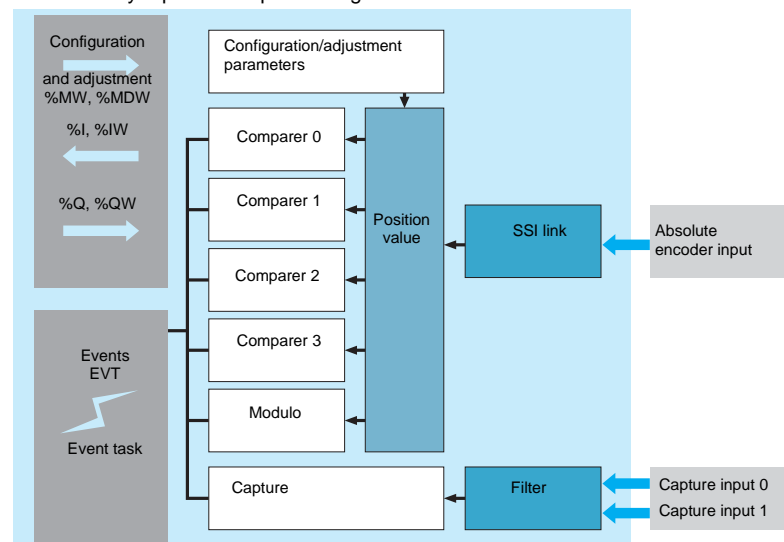

The front panel of the TSX CTZ 1B half-size positioning module (1 channel) includes:

- 1 A 9-pin SUB-D connector for connecting the SSI absolute encoder.
- 2 A high density 15-pin SUB-D connector for connecting:
  - 2 position value capture sensors ,
  - absolute encoder supply.

A latch system for fixing the module in the slot.

### Operation

Functional synoptic of the positioning channel:

Implementation of the TSX CTZ 1B requires the use of version  $\geq 4.2$  of the PL7 Micro/Junior/Pro software. The TSX Micro PLC receiving the module should be equipped with the operating system version  $\geq 5.0$ .

IEC 1131 conformity			Type 1 sensor
Detector compatibility			2 wire/3 wire (24 V) with the following specifications: <ul style="list-style-type: none"> <li>■ waste voltage at state 1 ≤ 7 V</li> <li>■ switched current ≤ 2.5 mA</li> <li>■ residual current ≥ 1.5 mA</li> </ul>

(1) Using an absolute encoder with parallel outputs requires the Telefast 2 ABE 7CPA 11 adaptation base. This base is used to multiplex up to 4 absolute encoders. This multiplexing is controlled by the TSX Micro PLC discrete outputs.

### Functions

Module type		TSX CTZ 1B	
Read frequency		Depending on mode: 200 kHz in slow mode 1 MHz in fast mode	
Comparative function		4 thresholds each linked to 1 maskable EVti event (activation upon event tasks) and to 1 position bit in relation to the (upper/lower) threshold	
Capture/measure function		2 capture inputs and 2 capture registers (on rising or falling edge)	
Modulo function		The number of encoder data bits can be configured, with: <ul style="list-style-type: none"> <li>■ The modulo function limits the dynamic of the position value to a number of points defined by the "modulo" parameter value. The "modulo" passage causes an EVti activation event for the event task</li> <li>■ The reduction function is used to reduce the position value supplied by the absolute encoder</li> </ul>	
Offset function		Two offset functions for the position measure are available: <ul style="list-style-type: none"> <li>■ Correction function for the encoder offset on the "zero" mechanical position</li> <li>■ Position measure adjustment function: corresponds to the position value adjustment (more or less)</li> </ul>	
Checks		The checks are of the following type: <ul style="list-style-type: none"> <li>■ Detecting the encoder feedback voltage</li> <li>■ Checking the encoder link</li> <li>■ Parity check</li> </ul>

## Ethernet network and TCP/IP Modem serial link

TSX Micro platforms connect to the Ethernet TCP/IP network via 2 external and autonomous TSX ETZ 410/510 modules. These modules are also used to link to an external modem.

### Ethernet TCP/IP TSX ETZ 410 module

The TSX ETZ 410 module includes:

- A Modbus/Uni-TE TCP/IP communication profile on Ethernet 10/100 Mbits/s or TCP/IP via RS232 serial link connected to an external 56K bit/s modem.
- The integrated Web server function. The integrated Web server provides access to:
  - the module configuration,
  - the PLC diagnostics system function, "Rack Viewer",
  - the communication diagnostics function,
  - the access function to the PLC data and variables, "Data Editor",
  - and accepts the scanned input/output function; the TSX ETZ 410 can be scanned by a device which supports the exchange of I/O Scanning input/outputs.

### Ethernet TCP/IP TSX ETZ 510 module

The Ethernet TSX ETZ 510 uses all the functions of the TSX ETZ 410 module, and in addition, the following functions on the level of the integrated Web server function.

- Graphic object editor function to assist in creating Web user pages.
- Configuration tool for the integrated WEB server.

### Integration into structures

The Ethernet TSX ETZ 410/510 modules communicate with the Micro TSX 37 10/21/22 PLCs, which are equipped with the operating system version IE ≥ 2.0. They connect:

- Via the:
  - TSX 37 10/21/22 PLC terminal port (TER),
  - TSX 37 21/22 PLC auxiliary port (AUX),
  - TSX SCP114 serial link PCMCIA card inserted into the TSX 37 21/22 PLC.
- On a Uni-Telway bus, via the TSX SCA 50 derivation box or the TSX P ACC 01 isolation box.

The Ethernet TSX ETZ 410/510 modules are configured with the assistance of a standard browser using:

- The Ethernet network.
- RS 232C serial link (PPP protocol).

The Ethernet TSX ETZ 410/510 modules ensure that the TSX Micro PLC TER port is duplicated; the PLC connected to the TSX ETZ 410/510 module via this TER port can be accessed locally by a programming terminal equipped with PL7 TSX Micro/Junior/Pro software.

# Modicon TSX Micro automation platform

Ethernet network and TCP/IP Modem serial link

TCP/IP profile on Ethernet and on the serial link by modem

Summary of the OSI structure

OSI model		Ethernet TCP/IP profile	Modem serial link
7	Application	Uni-TE Modbus	Uni-TE Modbus
6	Presentation	↑ ↓	↑ ↓
5	Session		
4	Transport		
3	Network	IP	IP
2	Link	Ethernet II or LLC IEEE 802.2 MAC IEEE 802.3	PPP
1	Physical	CSMA-CD IEEE 802.3	RS 232 point to point

The distributed automation applications can use a unique communication network which meet:

- The needs of real-time workshop performance.
- The open access requirements for the monitoring/commanding software based upon products using standard communication protocols or applications using Internet technology.

Ethernet and the point to point protocol (PPP) via serial link respond to different requirements in terms of data rate, capacity for open access on TCP/IP and flexibility in terms of topology.

Ethernet communication affects essentially the following applications:

- Co-ordination between programmable PLCs.
- Local or centralized supervision.
- Communication with production information management.
- Communication with remote inputs/outputs.

The various services offered are as follows:

- The TCP/IP protocol standard permits communication with:
  - the Quantum platforms in the Modbus messaging, with the 140 NOE 771 ●● module,
  - the M1E CPUs associated with the Momentum inputs/outputs I/O base in Modbus messaging,
  - the Premium platforms with TSX ETY 110 module (outside of Ethway profile) or TSX ETY 410●/510● module,
  - a PC terminal, which supports a standard browser for the Ethernet network,
  - a PC terminal, with a modem which supports a standard browser for the serial link,
  - all Uni-TE/Modbus TCP/IP devices (ATV 58 drive, Magelis terminals, etc.).
- The SNMP V1 network agent function. All Ethernet modules integrate the MIB II standard (Management Information Base RFC 1213) and the Ethernet Transparent Ready private MIB. These are compatible with the main network administration software available on the market.

Ethernet link

Modem link

# Modicon TSX Micro automation platform

## Ethernet network and TCP/IP Modem serial link

### Services linked to Ethernet applications

The TSX ETZ 410/510 modules integrate the services linked to the Ethernet applications:

- 1 Integrated Web server services:
  - ☐ IP configuration for the TSX ETZ 410/510 via standard browser on the Ethernet network or locally,
  - ☐ Access security,
  - ☐ PLC diagnostics system Function "RackViewer",
  - ☐ Communication diagnostics function,
  - ☐ Access function to the PLC data and variables, "Data Editor",
  - ☐ Download of Uni-TE PL7 applications,
  - ☐ Graphic object editor (only on TSX ETZ 510),
  - ☐ display of predefined Web pages,
  - ☐ User Web pages (only on TSX ETZ 510).
- 2 Scanned inputs/outputs service performed from the Premium or Quantum PLC (I/O Scanning function).
- 3 Uni-TE messaging in TCP/IP in Client/Server mode:
  - ☐ Remote terminal: Terminal transparency (see page 4/45).
- 4 Un-TE messaging in TCP/IP in Client/Server mode:
  - ☐ Conversion of Modbus requests to Uni-TE requests going to the TSX Micro PLC and vice versa for the reply.
- 5 TCP/IP messaging gateway to Uni-TE.
- 6 API calling/called (only for Modem link).

### Standard Ethernet services for TSX ETZ 410/510

The TSX ETZ 410/510 modules conform to the following standard protocols:

- BOOTP: attribution of IP address via a server (also for addressing by default or from a PC equipped with a standard browser).
- DHCP (1): automatic reconfiguration by replacing a faulty module (FDR function).
- SNMP (2): *network management protocol. The TSX ETZ 410/510 modules integrate the standard MIB II and the private Ethernet Transparent Ready MIB.*

(1) Only for Ethernet link:

**Bootstrap Protocol:** protocol for starting up terminals or stations without a disk via centralized management of network parameters.

**Dynamic Host Configuration Protocol:** protocol, which allows a station connected to a network to dynamically obtain its configuration.

(2) **Simple Network Management Protocol:** Network management protocol which is used to monitor a remote network by requesting the status of the stations and modifying their configuration, performing security checks and observing various information linked to data transmission. It can also be used to manage remote data bases and software.

# Modicon TSX Micro automation platform

Ethernet network and TCP/IP Modem serial link

## Scanned inputs/outputs service

The Ethernet ETZ 410/510 modules for the TSX Micro PLC accept the scanned I/O service, which is performed by the Premium or Quantum modules using the I/O Scanning service (TSX ETY 410●/510●, 140 NOE 771 ●●).

### Flow chart

This service is used to manage the exchange of remote inputs/outputs on the Ethernet network after a simple configuration and without the need for specific programming.

Inputs/outputs are scanned transparently with the assistance of read/write requests according to the Modbus protocol on the TCP/IP profile. This principle of scanning via a standard protocol is used to communicate with any device supporting a Modbus server on TCP/IP or with a built-in Modbus/Uni-TE converter on TCP/IP.

## Integrated Web server

The Ethernet TSX ETZ 410/510 modules have an integrated Web server. On a TSX Micro PLC level, the functions of the Web server allow:

- ☐ configuration,
- ☐ diagnostics,
- ☐ access to variables,
- ☐ graphic editing,
- ☐ display of predefined Web pages and
- ☐ use of a Web page configuration tool.

This server is a PLC real-time data server. All TSX Micro PLC CPU data which support one of these modules are presented in the form of standard HTML-web pages and can also be accessed by all standard browsers capable of embedded Java or by FactoryCast software (supplied on CD-Rom with each Ethernet module).

All functions from the Web server do not require any configuration or programming, either on the level of the TSX Micro PLC, or on the level of the compatible PC which supports the Internet browser. Furthermore, this module can be used in an existing configuration without any modification to the current program.

## Configuration function

The configuration function for the module is a predefined function. It allows:

- Altering the user name and password for access to the secure page.
- Configuration of the TCP/IP parameters.
- Configuration of the Uni-Telway parameters.
- Automatic re-configuration.
- Configuration of the SNMP parameters.
- The module reset.

## “Rack Viewer” function, TSX Micro PLC diagnostics

The predefined “Rack Viewer” function (display of PLC rack) is used to diagnose the TSX Micro PLC connected to the network via the Ethernet module. This is a predefined secure function (accessed using a password) which allows real-time display from a standard browser:

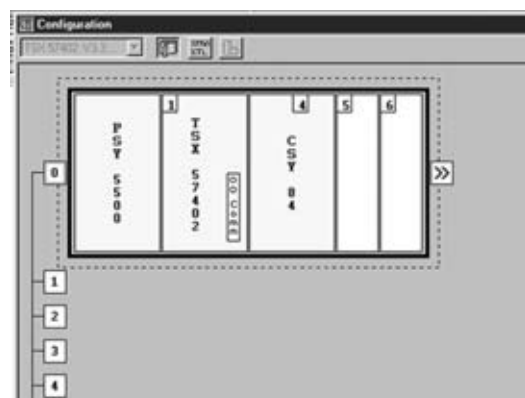

- The status of the LEDs on the front panel of the PLC.
- The version type of the PLC.
- The hardware configuration of the PLC with the status of the system words and bits.
- The detailed diagnostics of each I/O module or application share this configuration.

## Communication diagnostics function

The communication diagnostics function is a predefined secure function (accessed using a password) which allows real-time display from a standard browser:

- The Ethernet network statistics.
- The Uni-Telway bus statistics.
- The RS 232 Modem serial link diagnostics.

## “Data Editor” function, access to the PLC data and variables

The access to the variables function is a predefined and secure function (accessible by password) allowing the creation of an events table to access the list of PLC variables in read or write.

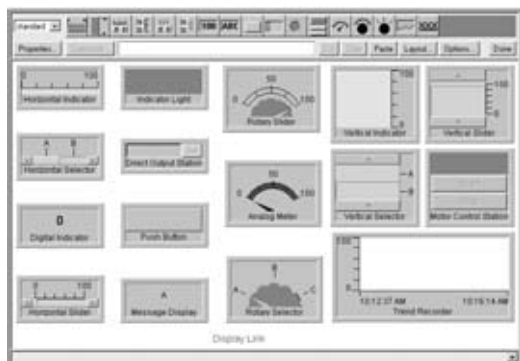

The variables to be displayed can be entered and displayed as:

- Address (%MW99) for the TSX ETZ 410 module.
- Symbol (S\_Pump 234) or address (%MW99) for the TSX ETZ 510 module.

In order to be able to write a value in a variable, you will need to enter and confirm a second password. The animation tables created by the operator can be saved in the Ethernet TSX ETZ 410/510 module.

# Modicon TSX Micro automation platform

Ethernet network and TCP/IP Modem serial link

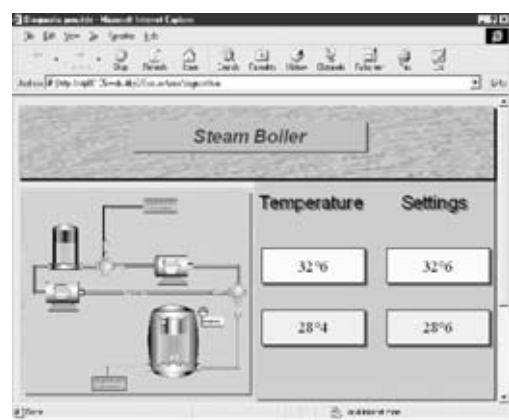

## Graphic object editor function

(available on the TSX ETZ 510 module)

The graphic object editor function enables you to create graphic designs, including animated graphic objects, linked to PLC variables. These customized designs can be used in user Web pages created with FactoryCast software.

These designs are created using simple cut/paste operations and the objects are set according to the needs of the user (color, PLC variables, label...). Once the designs have been created, they can be saved in a transparent way in the Ethernet TSX ETZ 510 module.

## Display of predefined Web pages

(available on the TSX ETZ 510 module)

The TSX ETZ 510 module also has an 8 M bytes (1) Flash EPROM type memory, which is accessible as a hard disk and permits the reception (hosting) of Web pages defined by the user.

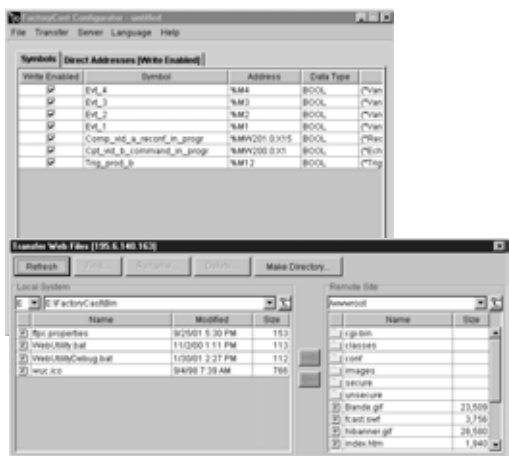

These Web pages can be created using any standard tool that lets you create and edit in HTML format. Eight pages can be enhanced by inserting animated graphic objects provided by the graphic object editor.

Once created, these Web pages allow you to:

- Display all PLC variables in real time.
- Insert hyperlinks to external servers (documentation, suppliers...).

This function is particularly useful for creating graphics and images intended for:

- Display, monitoring, diagnostics.
- Development of real time production reports.
- Maintenance assistance.
- User guides.

## FactoryCast configuration tool for the integrated WEB server

(only available on the TSX ETZ 510 module)

The FactoryCast software, version > 2.2.1 (supplied on the CD-Rom with the TSX ETZ 510 module), allows you to configure and administer the Web server embedded in the module. It is common to the TSX Micro, Premium and Quantum automation platforms.

It provides the following functions:

- Access security.
- Definition of the User names and associated passwords to access the Web pages.
- Definition of the access to the variables authorized in modification.
- Access to the PL7 application and to the TSX Micro PLC data.
- Save/restore a complete Web site.
- Transfer of Web pages created in local mode by the user on a PC-compatible workstation to the TSX ETZ 510 module and vice versa.

(1) Memory that is insensitive to power outages and to PLC resets.

# Modicon TSX Micro automation platform

## Ethernet network and TCP/IP Modem serial link

### Description of the TSX ETZ 410/510 modules

The Ethernet TSX ETZ 410/510 modules are autonomous and thus do not fit into a TSX Micro PLC rack, but fix onto a DIN profile or on AM1-PA perforated mounting plate.

The front of the TSX ETZ 410/510 modules are arranged as follows:

- 1 Three display LEDs indicating the module status (RUN, ERR, RX/TX).
- 2 A screened-on label indicating the module's MAC address (default address set in the M bit).
- 3 A mini DIN connector for terminal port (TER address).
- 4 An RJ45 connector for Uni-Telway auxiliary port RS 485 serial link (RS 485 address).
- 5 An RJ45 normalized connector for connecting to the Ethernet network (10/100BASE-T address).
- 6 A 9 pin male SUB-D connector for RS 232 serial link (Modem).
- 7 A screw terminal block for connecting to the external power supply  $\pm$  24 V.
- 8 A support plate enabling it to be fixed to the module.

### Wiring system

The TSX ETZ 410/510 modules support two kinds of exclusive TCP/IP connections:

- By Ethernet network via 10BASE-T/100BASE-TX (RJ45) interface, see page 4/21 for accessories and connection cables.
- By Modem via RS 232 serial link, see page 4/66 for accessories and connection cables.

The TSX ETZ 410/510 modules are connected to the TSX Micro PLCs TSX 37 10/21/22 via:

- The terminal port (TER) or the auxiliary port (AUX).
- The PCMCIA RS 485 TSX SCP114 serial link.

### Flow chart

The wiring chart opposite corresponds to one of the methods of connection.

The TSX ETZ 410/510 module is attached to the TSX Micro PLC via its terminal port (TER or AUX).

- 1 **TSX PCU 1031**: Uni-Telway connection cable between a compatible PC and the TER port of the TSX ETZ 410/510 module.
- 2 **TSX ETZ CDN 003**: connection cable (0.35 m cable, supplied with the TSX ETZ 410/510 module) between the module (rep. RS 485) and the TER/AUX port of the TSX Micro PLC. The **TSX CX 100** cable authorizes a connection with longer lengths (up to 10 m).
- 3 **490 NTW 000**: shielded twisted pair cable connection right of the module (rep. 10BASE-T/100BASE-TX) to Ethernet via hub (see page 4/21). Length from 2...80 m.
- 4 RS 232 cable between the SUB-D 9 connector contacts of the module (rep. RS 232) and the Modem.
- 5 Connection for external power supply  $\pm$  24 V (see Phaseo power supply page 2/61).

### Characteristics of the TSX ETY 410/510 modules

Type of link		Ethernet	Serial link by Modem
Structure	Nature	Local industrial heterogeneous network which conforms to the IEEE 802.3 standard	Telephone line (1)
	Topology	Star-shaped or tree-structure network	–
	Physical interface	–	RTC Link
	Protocol	–	Point-to-point protocol
Transmission	Mode	Manchester-type baseband	Half or full duplex
	Binary data rate	10/100 M bit/s with automatic recognition	RS 232 link to 56 K bit/s max
	Medium	10BASE-T, double shielded twisted pair of type STP, impedance 100 $\Omega \pm 15 \Omega$ 100BASE-T, Ethernet cable category 5 conforms to standard EIA/TIA 568A	Shielded RS 232 cable (crossover DTE/DTE)
Configuration	Number of stations	Point-to-point connection (via normalized RJ45 connector) enabling a star-shaped network to be formed (the stations are linked to hubs or switches). 64 stations max. per network	2 (point to point link)
	Length	100 m max. between terminal device and hubs	–

### Services and functions supported by the module

Shared services		<p>Different shared services:</p> <ul style="list-style-type: none"> <li>- scanned inputs/outputs service performed from the Premium/Quantum PLC with the I/O Scanning function</li> <li>- inter-PLC communication in Uni-TE or Modbus TCP/IP</li> <li>- download of Uni-TE PL7 applications</li> <li>- diagnostics module</li> <li>- remote terminal: Terminal transparency (see page 4/45)</li> <li>- adjustment, debugging and modifications to the program</li> </ul>

Integrated Web server function (2)		<p>Different Integrated Web server services:</p> <ul style="list-style-type: none"> <li>- maximum simultaneous connection of 8 standard browsers</li> <li>- IP configuration for TSX ETZ 410/510 module via standard browser</li> <li>- PLC diagnostics system function "RackViewer"</li> <li>- communication diagnostics function</li> <li>- access function to the PLC data and variables "Data Editor"</li> <li>- graphic objects editor (3)</li> <li>- Web pages defined by the user (8 Mb available) (3)</li> </ul>

### Electrical specifications

Supply voltage	Nominal	==	24
	Limits	==	19.2...30
Wave rate			5% max.
Accepted micro-cuts		ms	1
Permitted overvoltage		==	34 max. (for 1 hour in 24)
Power consumption	Nominal	mA	100
	Limits	mA	50...200
Power dissipation		W	2.4 (4 max.) without consumption on terminal port

### Environment

Conforming to standards	The TSX ETZ 410/510 modules conform to the TSX Micro PLC requirements (see page 1/13), which meet the following standards: ISO/IEC 8802-3, ANSI/IEEE Std 802.3 (4th edition 1993-07-08), conforming to the FCC-B rule for radiated emissions (50082-1)
-------------------------	--

(1) Transmission via Modem can also be by radio or satellite.

(2) Requires a standard browser on the PC (i.e. Internet Explorer version 4, Netscape version 4.05 or other) which is capable of executing Java code.

(3) Services available on the TSX ETY 510 module.

-------------------------------	---------------------------	--	--	---	-------------------	-------

(1) Requires a TSX 37 10/20/21 PLC with a version  $\geq 2.0$  operating system, supplied with a TSX ETZ CDN 003 link cable (0.35 m in length). These modules should be supplied with  $\geq 24$  V. (See supply process page 2/61).

(2) Supplied with CD-Rom including the FactoryCast V2.2.1 software, the Ethernet Transparent Ready Part A, the user manual for the Ethernet TSX ETZ 410/510 modules.

(3) Add the letter **U** to the end of the reference for CSA 22.1, NFPA 70 and UL approved cables (flame-retardant).

(4) Free wire on the side of the TSX SCA 50 connection box.

(5) If the 0.35 m of TSX ETZ CDN 003 cable, supplied with the TSX ETZ 410/510 modules, is not suitable, it is possible to use the TSX CX 100 cable (10 m in length). In this case, attach an 8 pin RJ45 connector (category 5) to the end of the free wire.

### Dimensions, mounting

#### TSX ETZ 410/510 modules

Mounting on profiled AM1 DE200 or AM1 DP200 or on AM1 PA mounting plate

(1) 136.2 mm with profiled AM1 DP200  
(2) Assembly on AM1 PA mounting plate

## ConneXium industrial Ethernet

### Presentation

As part of its Transparent Ready family of products, Schneider Electric offers a range of industrially hardened network hubs, switches, transceivers, bridges, and cables. These Ethernet-standard communication components enable you to integrate Ethernet solutions from the device level to the control network, and beyond to the corporate intranet. Each ConneXium Industrial Ethernet product is designed with compliance to Ethernet standards, and with third-party compatibility in mind.

- ConneXium Hubs connect devices and provide segments to shared communication among PLCs. TF Hubs are low-cost solutions which enable communications with devices, such as Momentum I/O, to Ethernet networks.
- ConneXium Switches segment the application in different zones, groups, or cells/machines. The proper placement of switches can increase network performance by relieving network congestion. TF switches implement SNMP protocol, allowing standard network management tools to monitor and diagnose the network, and thus are a key architectural component for real-time and deterministic network communication.
- ConneXium Transceivers provide connections to fiber optic networks in areas of high electromagnetic interference. The use of multiple transceivers enables long distances between process areas.
- ConneXium Bridges enable Modbus to Ethernet and Modbus Plus to Ethernet communications, with multiple ports allowing flexibility among network components.
- ConneXium Cables connect each automation device to the attached hub, switch, transceiver, or bridge. Cables are available in fiber optic and twisted pair options, with a wide variety of connectors and cable lengths.

All Ethernet cabling system components are built to rigorous industrial standards, and are designed to perform in harsh environments. ConneXium Switches and Hubs support a high level of resilience. Their scalable redundant features - from single to double ring structure - make it easy to build the kind of fault-tolerant network that fits the specific requirements of your environment.

## CANopen machine bus

### Presentation

Originally used in the automotive industry, CAN is increasingly used in general industry. Several fieldbuses based on CAN lower layers and components are available. The CANopen machine bus conforms to the ISO 11898 international standard, promoted by the CAN In Automation association, which consists of users and manufacturers and offers an excellent assurance of open access and interoperability due to its standardised devices and communication profiles.

The CANopen bus is a multimaster bus which ensures reliable deterministic access to realtime data in control system devices. The CSMA/CA protocol is based on broadcast exchanges, sent cyclically or on an event, which ensures optimum use of the passband. A message handling channel can also be used to define slave parameters.

The bus uses a double shielded twisted pair, on which 127 devices maximum are connected by daisy chaining. The variable data rate between 20 Kbps and 1 Mbps depends on the length of the bus (between 30 and 5000 m). Each end of the bus must be fitted with a line terminator.

The CANopen bus is a set of profiles on CAN systems, possessing the following characteristics:

- Open bus system.
- Data exchanges in real-time without overloading the protocol.
- Modular design allowing modification of size.
- Interconnection and interchangeability of devices.
- Standardised configuration of networks.
- Access to all device parameters.
- Synchronisation and circulation of data from cyclic and/or event-controlled processes (short system response time).
- Interoperability between numerous international manufacturers.

## Connectable devices

The TSX CPP 110 module performs the role of the master on the CANopen bus, and other Telemecanique devices (slaves) which can be connected on the bus are:

- TeSys model U starter-controllers.
- TeSys model d using the Tego Power installation assistance system.
- Advantys STB distributed I/O.
- Advantys FTB, IP 67 monobloc I/O splitter boxes.
- Advantys FTM, IP 67 modular I/O splitter boxes.
- Altivar 31, variable speed drives for asynchronous motors 0.18...15 kW.
- Altivar 58, variable speed drives for asynchronous motors 0.37...75 kW.
- Altivar 58F, variable speed drives with flux vector control for asynchronous motors 0.75...55 kW.
- Twin Line TLC servodrives for brushless motors 3...16 A.
- Lexium MHDA servodrives for brushless motors 1.5...70 A.

Are also compatible:

- Any third-party device which conforms to the CANopen standard profile.
- Any CAN device which uses CAN V2.0B identifiers on the ISO 11898 physical layer.

The TSX CPP 110 PCMCIA card supports the V4.02 CANopen standard with in particular the heartbeat network management.

TeSys model U

Advantys FTB

Altivar ATV 31

Twin Line TLC

Example of connectable devices on the CANopen bus

## Description

The Modicon TSX Micro/Premium platforms connect to the CANopen bus by means of the TSX CPP 110 type III PCMCIA card inserted in the processor or coprocessor communication port slot.

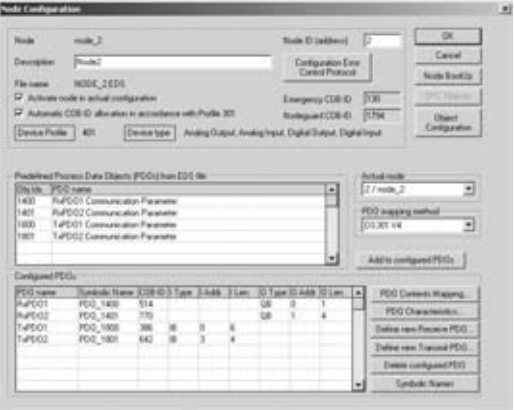

The TSX CPP 110 machine bus CANopen set comprises:

- 1 A PCMCIA card, type III with fixing screws.
- 2 A tap junction equipped with one 9-way SUB-D connector for connecting the CANopen bus.
- 3 A connection cable length 0.5 m, interdependent of the PCMCIA card and the tap junction.

TSX CPP 110

Software setup

Example of SyCon configuration devices screen

The CANopen bus is configured using dedicated SyCon (1) software, which should be ordered separately, reference SYS SPU LF● CD28M.

This software is used:

- To describe all devices connected on the bus.
- To generate the ".CO" file including the informations relating to the devices connected. This extension file is imported into the PLC application via the PL7 Micro/Junior/Pro programming software.

If the configuration file is too large in relation to the TSX Micro/Premium processor capacity (see characteristics table), it is possible to load the master configuration directly by inserting the TSX CPP 110 card in a PCMCIA port (type III) on the PC on which SyCon software has been installed.

In PL7, it is possible to configure the CANopen bus card so that the PLC processor/TSX CPP 110 card exchanges are executed at the same rate as the master task or the fast task.

The process data exchanged with the slaves can be accessed by %MW standard words, the number of which depends on the type of processor and the task in which the module has been declared. PL7 standard function blocks are used to define the device parameters.

**Nota :** In addition to supporting the CANopen protocol which uses V2.0A standard CAN identifiers on 11 bits, the card enables direct access to the CAN link layer via CAN V2.0B identifiers on 29 bits, used by the majority of CAN devices. In certain applications this enables simultaneous control of CANopen devices and dedicated CAN products.

(1) The SyCon field bus configurator software also makes it possible to describe the I/O configuration of Profibus DP bus for Modicon Premium and Modicon Quantum platforms and the I/O configuration of INTERBUS bus for Modicon Quantum platform.

Characteristics

Sycon configuration softwares

The SyCon software is the configurator for machine bus and field bus of Telemecanique.

It supports the buses:

- CANopen for TSX Micro et Premium platforms.
- Profibus DP for Premium et Quantum platforms.
- INTERBUS for Quantum platform.

The SyCon tool includes also the device description for Telemecanique I/O modules.

## TSX SAZ master module for AS-Interface bus

### Presentation

The TSX SAZ 10 AS-Interface bus module enables the TSX Micro PLC to act as the AS-Interface bus master. In this way up to 31 sensor/actuator type devices may be managed on the one AS-Interface bus. Up to 4 inputs and/or outputs can be connected to each device, giving a maximum of 248 I/O on one segment.

The AS-Interface bus comprises a master station (TSX Micro PLC) and slave stations. The TSX SAZ 10 module supports the AS-Interface M2 profile, interrogates the device connected on the AS-Interface bus in turn and stores the data (state of sensors/actuators, operational status of devices) in the PLC memory. Communication management on the AS-Interface bus is completely transparent with regard to the PLC application program. An AS-Interface power supply for bus must be used for powering the various components on the AS-Interface bus. Ideally this PSU should be situated nearest to the stations with the largest current demands. See page 2/51, Phaseo power supplies.

### Description

The TSX SAZ 10 AS-Interface bus master is a half-format module designed to slot into the basic configurations of TSX 37 10/21/22 TSX Micro PLCs, in position 4 (one TSX SAZ 10 module per configuration) (1).

The front panel comprises:

- 1 An opening with locating device for routing AS-Interface bus ribbon or round cable (to be connected to a terminal block inside the module).
- 2 Four indicator lamps:
  - RUN: the module is active,
  - ERR: module fault or bus connection fault,
  - COM: AS-Interface bus communication is active,
  - AS-Interface: bus configuration error.
- 3 A pushbutton to transfer the AS-Interface bus display to the PLC front panel.

### Diagnostics

The TSX Micro PLC centralised display block enables the display of the status of all the I/O channels, and the diagnostics for devices on the AS-Interface bus (present, missing, faulty, not conforming to the configuration):

- 1 Device number.
- 2 Control pushbutton for accessing the various operating modes of the display block.
- 3 State of the 4 device inputs.
- 4 State of the 4 device outputs.

(1) When the TSX SAZ 10 module is in position 4, the upper position 3 can only receive a TSX A●●● analogue or TSX CTZ ●●● counter half-format module.

Master modules for AS-Interface bus

4

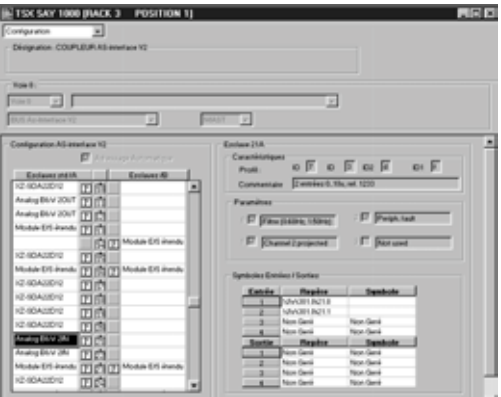

1.2

Declaration of the TSX SAZ 10 TSX Micro module

Configuration of slave devices for TSX SAY 100

Configuration of slave devices in TSX SAY 1000

## Software setup

The AS-Interface bus is configured using PL7 Micro/Junior/Pro software. The services offered are based on the principle of simplicity:

- Management of profile tables, parameters and data by the master (this management is transparent to the user).
- Topological I/O addressing: each AS-Interface slave declared on the bus is assigned a topological address on the bus. This is transparent to the user.
- Each sensor/actuator for the AS-Interface bus interfaces is treated as an in-rack I/O by the TSX Micro/Premium PLC.

## AS-Interface bus configuration

All devices on the AS-Interface bus are configured implicitly using the following sequence of screens:

### ■ Declaration of the AS-Interface bus master module

- The TSX SAZ 10 module is always inserted and declared in position no. 4 on TSX 37 10/21/22 TSX Micro automation platforms.
- TSX SAY 100/1000 modules can be inserted into any position on TSX/PCX 57 Premium automation platforms (except positions reserved for processors and power supplies).

### ■ Configuration of AS-Interface slave devices

Using the configuration screen, it is possible to configure all the slave devices corresponding to all interface I/Os on the AS-Interface bus. Depending on its type, the configuration for each device consists of defining, as appropriate:

- Schneider Electric AS-Interface devices.  
The user selects the AS-Interface device catalog reference from the various discrete, analog, or safety interfaces listed. This selection automatically determines the AS-Interface profile and the parameters associated with each interface.
- Third-party AS-Interface device.  
The user can use PL7 Micro/Junior software to manage a “customized” list of sensors/actuators of different brands. This list, specifying the AS-Interface profile and parameters, is compiled to meet the needs of the user.

## Programming

After configuration, the I/Os connected on the AS-Interface bus are processed by the application program in the same way as an in-rack I/O of the PLC, using either the address (e.g. %I4.0\16.2, input 2 of slave 16 of the AS-Interface bus), or the associated symbol (e.g. Start\_conveyor).

PL7 Junior/Pro software has an integrated function block library containing the specific diagnostic DFBs for AS-Interface bus. Its check for the appearance of any error on the AS-Interface (bus or slaves).

## Diagnostics

Diagnostics of the TSX SAY 100 module using PL7

Diagnostics of the TSX SAY 1000 module using PL7

Diagnostics performed using the centralized display unit of the TSX Micro platform or using the display unit of TSX SAY 100/1000 modules can be completed using a PC terminal on which PL7 Micro/Junior/Pro software has been installed.

The terminal connected to the TSX Micro/Premium PLC is used to perform diagnostics of the operating state of the AS-Interface V1 TSX SAY 10 and TSX SAY 100 master modules, the bus and the slave devices on the bus.

For the AS-Interface V2 TSX SAY 1000 master module, the diagnostics are identical to those of the AS-Interface V1 module, and in addition, take into account developments in the M2E standard.

Diagnostics are performed using a single screen divided into four sections providing information on:

- 1 Status of the TSX SAY 10 or TSX SAY 100/1000 module (RUN, ERR, I/O).
- 2 Status of the AS-Interface channel connected to the module.
- 3 Faulty interface (or slave).
- 4 Data relating to any selected interface (profile, parameters, forcing, etc.).

In the event of an AS-Interface module or channel fault, a second screen can be accessed, which clearly shows the type of fault, which may be at internal or external level.

4

4.2

## Characteristics

Type of module		TSX SAZ 10	TSX SAY 100	TSX SAY 1000
AS-Interface profile		M2(AS-Interface V1)		M2E (AS-Interface V2)
Type of addressing		Standard		Standard and extended
Product certification		AS-Interface No. 12001, IEC 61131 2	AS-Interface No. 18801, IEC 61131 2	Pending
Ambient air temperature	Operation	0...+60 °C.		
	Storage	-25...+70 °C.		
Degree of protection		IP 20		
Vibration resistance		Conforming to IEC 68 2 6. Fc tests.		
Shock resistance		Conforming to IEC 68 2 27. EA tests.		
Number of connectable interfaces (or slaves)	With standard addressing	31 slaves		
	With extended addressing	–		31 slaves
Type of connectable interfaces	With standard addressing	Discrete I/Os (4I/4O)		Discrete I/Os (4I/4O) (1) Analog I/Os (a maximum of 4 channels) Safety interfaces
	With extended addressing	–		Discrete I/Os (4I/3O)
Bus connection		By terminal block inside module (polarity locating device)	By 3-way SUB-D connector (included with the module)	
Module power supply		Via power supply integrated into the host platform of the module		
Display/diagnostics		Via: <input type="checkbox"/> centralized display unit on TSX Micro PLC or via the display unit of TSX SAY 100/1000 modules <input type="checkbox"/> use of the PL7 Micro/Junior/Pro software diagnostics function <input type="checkbox"/> use of the ASI-TERV1 adjustment console (infrared link)		

(1) If the interfaces are connected using extended addressing, the type of discrete I/Os is 4I/3O (instead of 4I/4O).

# Modicon TSX Micro automation platform

Phaseo regulated switch mode power supplies for AS-Interface

## Power supplies for AS-Interface

Consistent with the standard Phaseo line, the range of ASI ABL power supplies is designed to deliver a d.c. voltage, as required by networks operating under the AS-Interface protocol. Three versions are available to meet all needs encountered in industrial applications, in enclosures, cells or floor-standing enclosures. These single-phase, electronic, switch mode power supplies guarantee the quality of the output current, in accordance with the electrical characteristics and conforming to standard EN 50295.

■ **ASI ABLB300●**  
Operating on a 100 to 240 V a.c. supply, this power supply delivers a voltage of 30 V d.c. Available in 2.4 and 4.8 A ratings, the parallel output terminal blocks allow the bus to be connected separately to the slaves and the master. Input and output LEDs allow fast and continuous diagnostics.

■ **ASI ABLD300●**  
Operating on a 100 to 240 V a.c. supply, this power supply delivers a voltage of 30 V d.c. Available in 2.4 and 4.8 A ratings, it allows diagnosis and management of earth faults on AS-Interface networks. In the event of an earth fault, the Phaseo power supply trips out, thus stopping dialogue on the bus. Restarting is only possible after deliberate acknowledgement of the fault. Two I/O are provided, which may be used to monitor status. The parallel output terminal blocks are used to connect the bus separately to the slaves and the AS-Interface master. Input, output and fault LED's allow fast and continuous diagnostics.

**Warning:** the earth (GND) (2) connection must be made. In the event of disconnection, the built-in detector becomes inoperative. To obtain earth connection diagnostics, it is recommended that an ASI ABLB300● power supply be used together with insulation relay RMO PAS 101.

■ **ASI ABLM3024**  
Operating on a 100 to 240 V a.c. supply, this product delivers two d.c. outputs which are totally independent in the way they operate. Two output voltages - 30 V d.c./2.4 A (AS-Interface supply) and 24 V d.c./3 A - are available, so making it possible to supply the control equipment without an additional power supply. Input and output LEDs allow fast and continuous diagnostics.

(1) Recommended connection.  
(2) Compulsory connection.

Output characteristics

Derating

The ambient temperature is a determining factor which limits the power that an electronic power supply can deliver continuously. If the temperature around the electronic components is too high, their life will be significantly reduced. The graph below shows the power (in relation to the nominal power) which the power supply can deliver continuously, according to the ambient temperature.

## Modbus Plus network

## Presentation

The Modbus Plus network is a high-performance industrial local network which can respond to Client/Server type extended architectures, combining a high data rate (1 Mbit/s), simple and economical transmission support and several message handling services.

The main data exchange functions between all devices connected to the network are:

- The message exchange function according to the Modbus protocol.
  - The "global database" function (Shared Table service, periodic, controlled by the application: a station with the token can send 32 words to a maximum of 63 other stations connected on the network).
- 1 The Premium (or TSX Micro) client communicates with the Quantum server on the Modbus Plus network via function block (communication function).
  - 2 The Quantum client communicates with the Premium server on the Modbus Plus network via MSTR function blocks.
  - 3 A Premium (or TSX Micro) client connected to the Ethernet TCP/IP or Fipway network can communicate in read/write mode with a Modbus Plus station (the Premium PLC therefore acts as a gateway).
  - 4 A Premium (or TSX Micro) client connected to the Modbus Plus network can access a remote station via the Modbus Plus/Modbus gateway.
  - 5 A Premium client connected to the Modbus Plus network can make exchanges with the Momentum distributed inputs/outputs via the Peer cop function.

Description

The type III TSX MBP 100 card is used to connect the Premium/TSX Micro PLCs and Atrium coprocessor to the Modbus Plus network. This card is installed in the slot reserved for processors or coprocessors:

- 1 A host slot on processors or coprocessors.
- 2 A protective cover.
- 3 A removable cover with fixing screw (access to 20-way miniature connector).
- 4 Two indicator lamps:
  - ERR: card or link fault,
  - COM: activity on the line.

Connectors to be ordered separately:  
□ TSX MBP CE 0●● drop cables.

Characteristics

Structure	Type	Industrial bus
	Physical interface	RS 485
	Method of access	Token bus
Transmission	Mode	Synchronous HDLC
	Data rate	1 Mbit/s
	Medium	Twisted pair
Configuration	Number of devices	32 per segment, 64 maximum on all segments (1,800 m maximum)
	Number of addresses	64 devices maximum per segment
	Length of bus	450 m maximum per segment, 1,800 m maximum with 3 repeaters
	Number of segments	Cascaded: 5 maximum using Modbus Plus BP85 bridges
Services	Global database	- 4096 byte common database - cyclical exchange of 32 broadcast words
	"Peer to peer" dialogue	Read/write services (number of requests: 100 registers per transaction)
	Peer Cop	Cyclical exchange service (on Premium only): 500 words per station (broadcast or point-to-point)

# Modicon TSX Micro automation platform

## Modbus Plus network

### Wiring system

- 1 TSX MBP 100:** Modbus Plus PCMCIA card, for type III processor slot on TSX Micro or Premium platforms.
- 2 170 PNT 110 20:** communication module for Momentum I/O base unit.
- 3 490 NAA 271 0●:** trunk cable, shielded twisted pair with shielding drain (flying leads). In lengths of 30, 150, 300, 450 or 1,500 m.
- 4 170 MCI 020/021 ●●:** drop cable equipped at each end with an RJ45 connector (baseT interface). In lengths of 0.25, 0.75, 3 or 10 m.
- 5 990 NAD 230 00:** IP 20 local site tap, provides a tap link from the trunk cable for connecting 1 device (connection of conductors requires wiring tool 043 509 383). Integrates the line terminal.
- 6 990 NAD 230 10:** IP 65 zamac local site tap, provides a tap link from the trunk cable for connecting 1 device (screw terminal connection). It also has an RJ45 connector for connecting a programming and maintenance terminal.
- 7 170 XTS 020 00:** IP 20 tee, provides a tap link from the Modbus Plus cable (cable with connectors at each end of an RJ45 connector). It has a 9-way SUB-D female connector for connecting the device.
- 8 TSX MBP CE 030/060:** drop cable for Modbus Plus PCMCIA card, equipped on the PCMCIA side with a 20-way miniature connector and with flying leads on the 990 NAD 230 00/010 local site tap side. In lengths of 3 or 6 m.
- 9 990 NAD 211 10/30:** drop cable equipped on the device side with a 9-way SUB-D male connector and with flying leads on the 990 NAD 230 00/010 local site tap side. In lengths of 2, 4 or 6 m.
- 10 TSX MBP CE 002:** drop cable for Modbus Plus PCMCIA card, equipped on the PCMCIA side with a 20-way miniature connector and on the network side with a 9-way SUB-D female connector. Can be used as an extension for cable 990 NAD 211 10/30. In lengths of 0.2 m.
- 11 AS MBKT 185:** set of 2 line terminators (impedance adapter) to be placed at each end of the segment. The AS MBKT 185 terminators are placed directly at the end of the cable (without a tap or tee).  
**990 NAD 230 11:** set of 2 line terminators (impedance adapter) for IP 65 local site tap 990 NAD 230 10, to be placed at each end of the segment.
- 12 170 XTS 021 00:** set of 2 line terminators (impedance adapter) for tee 170 XTS 020 00, to be placed at each end of the segment.

For wiring system:

- Quantum platform: please refer to our catalog.
- Lexium drive for brushless motors: please refer to our catalog "Lexium movement command".
- Altivar drive for asynchronous motors: please refer to our catalog "Progressive starters and speed controllers".

### Presentation

The Modbus bus is used for master/slave architectures (it is necessary, however, to check that the Modbus services used by the application are implemented on the devices concerned).

The bus comprises one master station and several slave stations. Only the master station can initiate the exchange (direct communication between slave stations is not possible). Two exchange mechanisms are possible:

- Question/answer, where the requests from the master are addressed to a given slave. The master then waits for the response from the slave which has been interrogated.
- Broadcasting, the master broadcasts a message to all the slave stations on the bus. These stations execute the order without transmitting a response.

### Description

The TSX Micro/Premium PLCs or Atrium coprocessors offer various Modbus bus connection possibilities.

#### Built-in links to the TSX Micro processor or to the TSX SCY 11601 Premium module

- 1 Via integrated port on the TSX Micro processor.  
The TER port (8-way mini DIN) has Modbus RTU master/slave (1) protocol.
- 2 Via integrated port on the TSX SCY 11601/21601 module for Premium PLCs.  
This module has an isolated Half-duplex RS 485 serial link channel (25-way SUB-D connector) with multiprotocol (including Modbus); (for the TSX SCY 11601 module, only the Modbus protocol is supported).

#### TSX SCP 11 multiprotocol PCMCIA cards

- 3 A slot on the TSX Micro/Premium processors, the Atrium coprocessor and the TSX SCY 21601 module(2) exists for the multiprotocol TSX SCP11 cards, including Modbus, featuring:
  - 4 A protective cover.
  - 5 A removable cover with fixing screws (to access a 20-way miniature connector).
  - 6 Two LEDs:
    - ERR lamp: card or link fault,
    - COM lamp: data transmission or reception.

Cable connector to be ordered separately: TSX SCP/SCY cable.

(1) Modbus RTU slave Protocol with TSX 37 05/08.

(2) This slot is also designed for Fipway TSX FPP 20 or Jnet TSX JNP 112/114 PCMCIA network cards.

X-Way and the OSI model

The communication architecture of the programmable TSX Micro/Premium PLCs, like that of TSX 17 or TSX model 40 PLCs, is compliant with the OSI model.

The physical layer enables the physical transmission of data signals between 2 systems via a medium. In order for a network to operate correctly, and to ensure full security of personnel in compliance with IEC 1131 2, it is necessary to implement the wiring recommendations described in the reference manual TSX DR NET F “X-Way communication” (or in the TSX CD DMTE 13E CD-ROM “Technical documentation”).

The application layer concerns application programs, data exchange and cooperation conventions.

This layer provides the following services:

- Industrial Uni-TE message, available on TSX Micro/Premium/TSX PLCs.
- Distributed COM database available on TSX Micro/Premium/TSX PLCs, or Shared Table service available on TSX Micro/Premium PLCs.
- Periodical data exchange on Fipio bus, see page 4/50.
- Application-to-application communication.
- Telegram.

Size of requests	Ethway, Ethernet TCP/IP (1)	Fipway	Fipio	Uni-Telway
Uni-TE service	256 bytes (2)	128 bytes	128 bytes	240 bytes (3)
COM service	256 word database (4)	128 word database	—	—
Application-to-application	256 bytes	128 bytes	128 bytes	240 bytes (3)
Telegram	—	16 bytes	—	—

(1) Ethway not available on TSX Micro PLC.  
(2) 1 K bytes with requests executed as a background task.  
(3) 128 bytes on TSX Micro/Premium/TSX model 40 terminal port, 32 bytes on TSX 17 20/47 20/25.  
(4) COM service not available with Ethernet TCP/IP.

Uni-TE services

The Uni-TE protocol is the industrial message handling system supported by the X-Way communication architecture. It operates on the question/answer or request/confirmation principle. A device which supports the Uni-TE protocol can be a:

- Client: this device initiates communication. It asks a question (reads), transmits data (writes) or sends an instruction (Run, Stop, etc.).
- Server: this device executes the service requested by the client and sends a confirmation after execution.

The services provided depend on the type of device (PLC, numerical controller, programming terminal, supervision station, etc.). Depending on its function, each device can be Client and/or Server. A Client PLC can access other devices on the architecture via its application program: It can read/write objects on another PLC or numerical controller, select programs on a numerical controller, etc.

### Network transparency

When connected to any station in the network or directly connected to the Fipway/Ethernet TCP/IP network, a programming terminal can communicate with any other station in the network (as if the terminal were physically connected to the PLC with which it is dialoguing).

Network transparency also applies between stations connected to different segments of the same multinet architecture.

### COM service and Shared Table service (exclusive services one from another)

**The COM service** is made up of a set of dedicated words called common words. Each Fipway/Ethway network station may or may not access the database (in read only or read/write mode).

All PLC stations exchanging common words (32 stations on Fipway, 64 stations on Ethway) are allocated, in a dedicated database (128 words for Fipway, 256 words for Ethway), a write zone (set at 4 words for the Fipway network, and variable from 4 to 64 words for the Ethway network) per TSX Micro/Premium station.

COM words are updated automatically during each scan of the general sequential program (master task) without the intervention of the application program.

**The Shared Table service** can be used to exchange a table of internal words divided into as many zones as there are TSX Micro/Premium PLCs which comprise the Fipway network. The exchange principle is based on the broadcasting, by each PLC, of a word memory zone (broadcast zone) to the other PLCs on the network. Each network station is allocated an exchange table comprising 128 internal words for the 32 PLCs that share the service, with a broadcast zone assigned to each PLC, variable from 1 to 32 internal words.

### Application-to-application communication

This consists of using the user application program to send word tables between 2 devices, which may be TSX Micro/Premium and TSX PLCs.

This service is particularly suitable for:

- Sending alarm messages from a PLC to a supervision station.
- Exchanging data tables between two PLCs controlled by the application programs of the transmission and destination device.
- Sending broadcast messages to all stations and devices.

### Telegram

The telegram service available on Fipway is a special case of application-to-application messages. It enables short messages to be sent and received on a priority basis (maximum 16 characters).

A telegram from a TSX Micro/Premium PLC is sent immediately without waiting for the end of the cycle. The telegram is received by the TSX Micro/Premium PLC in:

- The event-triggered task (processed as soon as the message arrives in the network card).
- The fast task or master task (when scanning the reception function).
- A PLC can only process one telegram at a time.

### Use in a multinet

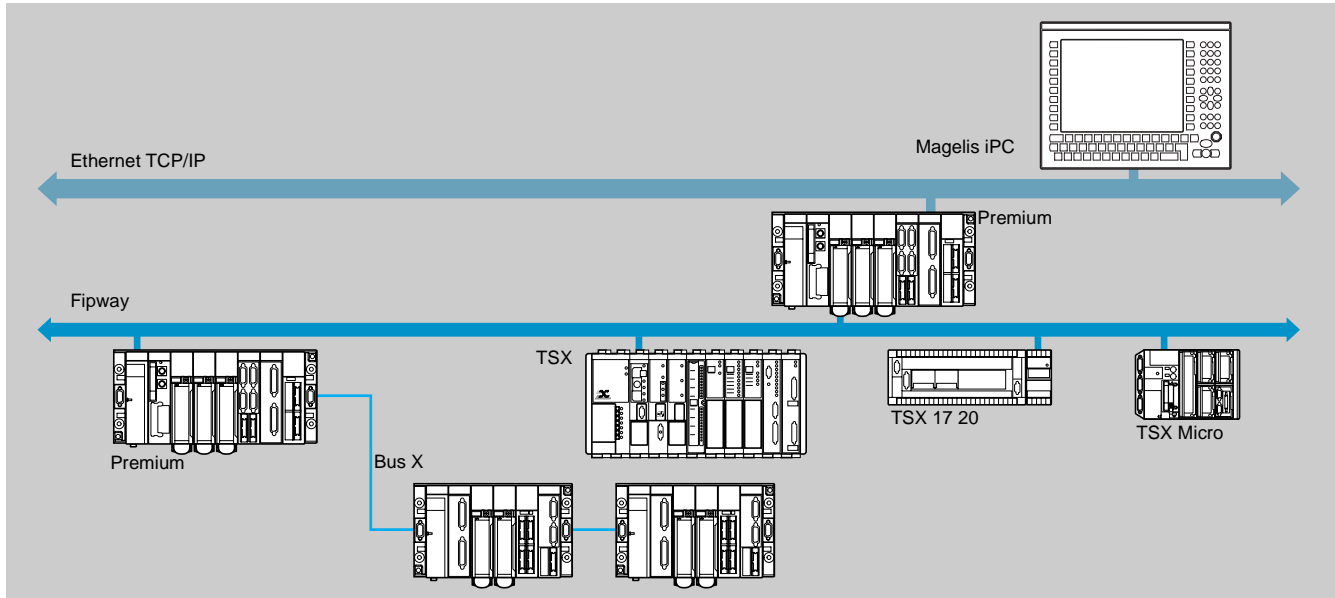

The X-Way communication architecture is designed to cover multinet applications capable of dealing with problems of:

- Concentration, the architecture is particularly suitable for feedback of supervision data to a higher level.
- Redundancy, each PLC monitors the correct operation of both networks to which it is connected. If one of the networks should fail, all traffic could be transferred to the valid network.
- Inter-network communication. These architectures comprise several network segments which are interconnected by "bridge PLC" stations. Transparent communication is then offered between the entire architecture.

# Modicon TSX Micro automation platform

## Fipway network

### Presentation

The Fipway network is an open local area network for communication between the various TSX Micro, Premium and TSX Series 7 PLCs using the X-Way services. Communication conforms to the FIP standard with access via a bus arbitrator.

TSX Micro (TSX 37 21/22) and Premium PLCs can be connected to a Fipway network using a Fipway PCMCIA card which is inserted in each processor or into the TSX SCY 21601 (Premium) communication module. Supported X-Way services (see pages 4/44 to 4/45) are:

- Uni-TE services.
- Distributed database (COM) or Shared Table.
- Telegram (service only available when the PCMCIA card is inserted in the processor).
- Application-to-application communication.

For characteristics, Fipway network wiring and connection accessories, see pages 4/56 to 4/59.

### Characteristics

The Fipio industrial fieldbus is standard of communication between various control system components. It conforms to the WorldFip standard.

Type of bus/network			Fipway network
Structure	Type		Open industrial fieldbus conforming to WordFip standard
	Topology		Devices linked by daisy-chaining or tap link connections
	Maximum length	m	5 000
	Access method		Producer/consumer principal Management by fixed arbitrator
Transmission	Mode		Physical layer in baseband on shielded twisted pair, conforming to NF C 46 604
	Data rate	Mbit/s	1
	Medium		150 $\Omega$ shielded twisted pair, 62.5/125 ou 50/125 fibre optic using electrical/fibre optic repeaters
Configuration	Number of devices	Per segment	32 stations
		Maxi	64 stations
	Segments	Number	Unlimited
		Length	m 1 000 maximum per electrical segment 3 000 maximum per optical segment
Services	COM (1)		Distributed database: 128 mots maximum 0 or 4 % NWi words for TSX Micro and Premium station with addresses 0 to 31
	Shared table(1)		Shared table of internal words: 128 words maximum 1 to 32 % MWi words per TSX Micro and Premium station with addresses 0 to 3 (2)
	Uni-TE		Point-to-point requests with confirmation report: 128 bytes maximum, can be used by all devices connected to the same X-Way architecture (access by the Client device to the Server device system functions)
	Application-to-application		Point-to-point messages: 128 bytes maximum between 2 devices, can be used by all TSX Micro (1)/Premium/TSX Serie 7
	Telegram		Point-to-point priority messages: 16 bytes maximum between 2 Premium (3) or TSX Series 7 stations with addresses 0 to 15
	Security		Control characters in each frame and acknowledgement of point-to-point messages conforming to standard NF C 46 603

(1) The COM and Shared table service are mutually exclusive.

(2) Service reserved for TSX Micro and Premium PLCs.

(3) Service only available when Fipway PCMCIA card is installed in the processor.

Performances

The operating principle of a Fipway network gives ensured, constant network cycle times whatever the traffic and number of stations (2 to 64). This enables the Fipway network to be updated (addition or removal of stations) without changing the performance.

Maximum transmission time

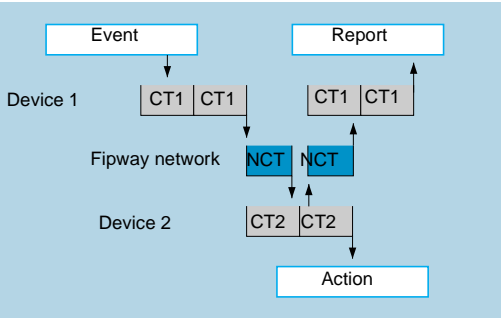

- Telegram (TLG): priority application messages are transmitted in less than 10 ms (one telegram per station).
- Common words (COM): the database of common words is updated every 40 ms.
- Shared Table: the exchange table is updated every 40 ms.

Uni-TE message handling system: Uni-TE or standard application-to-application messages are normally transmitted in less than 80 ms (40 ms for stations with addresses below 32). Where there is a large amount of traffic, some messages can wait for several cycles before being transmitted. The network characteristics enable a maximum of 210 messages of 128 bytes per second to be transmitted.

The performance can be improved by inhibiting the Telegram service in the network. With such network characteristics, the response time at application level depends almost exclusively on the processing capacity of the devices which are connected. For example, the remote loading of a 50 K word program takes less than two minutes on a network with normal load.

CT1 = Cycle time of device 1.  
NCT = Cycle time of Fipway network.  
CT2 = Cycle time of device 2.

The response time must be evaluated by the designer of each application in relation to the devices connected.  
The processing time of a device can vary from one to two cycle times as a function of asynchronous operation.

Connectable devices

TSX 7 PLCs

Connection via Fipio/Fipway integrated link or via the TSX FPM 100 module of TSX/PMX model 40 PLCs. Connection via the TSX FPG 10 module of TSX 17 20 TSX Micro PLCs.

Magelis iPC industrial PC

Equipped with TSX FPC 10M for PC compatible (ISA bus). They access all devices in the X-Way architecture. The various X-Way drivers are available on CD-ROM, see page 5/19.

Magelis operator dialogue terminals

Connection via the TSX FPP 20 PCMCIA card.

Description

TSX Micro/Premium PLCs have a slot on the processor for a type III PCMCIA communication card. This can be fitted with the TSX FPP 20 fipway network connection card, which is also inserted into the TSX SCY 21601 communication module slot.

The TSX FPP 20 card comprises:

- 1 Protective cover
- 2 Removable cover with fixing screws for access to the 20-way miniature connector
- 3 Two indicator lamps:
  - ERR lamp: card fault, link fault,
  - COM lamp: data transmission or reception.

Connector to be ordered separately:  
TSX FP CG 010/030, 1 or 3 m cable for connection to the TSX FP ACC 3/ACC 4 T-junction box (on 9-way SUB-D connector).

## Fipio bus Agent function

### Presentation

TSX Micro (TSX 37 21/22) or Premium PLCs, fitted with a TSX FPP 10 PCMCIA card on their integrated communication channel, are agents on the Fipio bus. The bus manager is a TSX P 57 153/253/2823/353/453/4823, Atrium coprocessor T PCX 57 203/353.

The Fipio bus enables I/O to be remotely located close to the devices to be controlled (Momentum, Altivar, etc). The Agent function enables offline processing, by locating a TSX Micro PLC close to the machine.

In addition to the standard Fipio services (see pages 4/39 to 4/45), TSX Micro (TSX 37 21/22) and Premium PLCs allow exchanges of input and output variables with the bus manager PLC. These exchanges are performed cyclically, automatically and without the involvement of the application program at the same rate as the task for which the agent PLC has been configured.

For characteristics, Fipio bus wiring system and connection accessories, see pages 4/50 to 4/59.

### Application services

The application services supported by TSX Micro (TSX 37 21/22) and Premium Agent function PLCs are:

- Uni-TE service, X-Way industrial message handling service suitable for operator dialogue, diagnostics and control functions (requests of up to 128 bytes).
- Application-to-application communication service, which consists of the transmission of tables between 2 devices controlled by their respective application programs (messages of up to 128 bytes).
- New periodic data exchange service for exchanging a 64 word table between the bus manager PLC and the Premium Agent PLC. Software setup see page 4/52.

### Characteristics

The Fipio industrial fieldbus is standard of communication between various control system components. It conforms to the WorldFip standard.

Type of bus/network			Fipio bus
Structure	Type		Open industrial fieldbus conforming to WordFip standard
	Topology		Devices linked by daisy-chaining or tap link connections
	Maximum length	m	15 000
	Access method		Producer/consumer principal Management by fixed arbitrator
Transmission	Mode		Physical layer in baseband on shielded twisted pair, conforming to NF C 46 604
	Data rate	Mbit/s	1
	Medium		150 $\Omega$ shielded twisted pair, 62.5/125 ou 50/125 fibre optic using electrical/fibre optic repeaters
Configuration	Number of devices	Per segment	32 connexion points per segment
		Maxi	128 on all segments
	Segments	Number	Unlimited
		Length	m 1 000 maxi per electric segment 3 000 maxi per optical segment
Services	Input/output exchanges		Periodic and deterministic exchanges of variables between bus manager PLC and Agent PLC (64 %MWi consecutive words: 32 %MWi for transmission and 32 %MWi for reception)
	Uni-TE		Point-to-point requests with confirmation report: 128 bytes maximum, can be used by all devices connected to the same X-Way architecture (access by the Client device to the Server device system functions)
	Application-to-application		Point-to-point messages: 128 bytes maximum between 2 devices, can be used by all TSX Micro(1)/Premium/TSX Serie 7
	Security		Control characters in each frame and acknowledgement of point-to-point messages conforming to standard NF C 46 603

(1) TSX 37 21/22 only.

Software setup

Each TSX Micro/Premium PLC Fipio Agent uses 64 %MWi consecutive internal words to exchange periodic data. The first 32 words are reserved for sending data to the manager, and the remaining 32 are reserved for receiving data from the manager.

PL7 Micro/Junior/Pro application-specific screens allow the configuration of the Fipio Agent PCMCIA card. This consists of:

- Indicating the connection point number (1 to 127).
- Indicating the address at the beginning of the 64 %MW word table reserved for sending data to and receiving data from the manager.

Description

TSX Micro (TSX 37 21/22)/Premium PLCs have a slot in the processor for a type III PCMCIA communication card. This can be fitted with a TSX FPP 10 Fipio bus connection card.

The TSX FPP 10 card comprises:

- 1 A protective cover.
  - 2 A removable cover with fixing screws giving access to the 20 way miniature connector.
  - 3 Two indicator lamps:
    - ERR lamp: card fault, link fault,
    - COM lamp: transmission or reception of data.
- Connector to be ordered separately:
- 4 TSX FP CG 010/030, 1 or 3 m cable for connecting the TSX FP ACC 4 tap junction (on 9-way SUB-D connector).

## Fipio/Fipway optic transceiver

### Presentation

The OZD FIP G3 optic transceivers are particularly adapted for use with applications which are subject to harsh electrical environments or which are distributed over large areas:

- Public buildings.
- Large-scale industrial sites.
- Water treatment and distribution.
- Transport and highway tunnel infrastructures, etc.

The OZD FIP G3 optic transceiver enables conversion of a FIP electric interface to 2 FIP optic interfaces and vice versa. As a result, it allows redundant ring topologies to exist; these improve installation availability even when a line is broken at a point in the medium.

In these situations, the length of the bus or the Fipio/Fipway ring can reach 20 Km, with a maximum of 32 Fipio or 20 Fipway transceivers. See characteristics on page 4/49. These characteristics may be increased using mixed topologies such as 2 serial optic rings or 2 serial optic buses; please consult our regional office.

### Wiring system

- 1 **OZD FIP GG3:** Fipio/Fipway optic transceiver.
- 2 **TSX FP CA●00:** 150  $\Omega$  shielded twisted pair trunk cable (diameter 8 mm) for use in standard environments and inside buildings.
- 3 **TSX FP CG 0●0:** tap-off connection cable for TSX FPP 10/20 PCMCIA module card for TSX Micro/Premium PLCs.
- 4 **TSX FP ACC 3/4:** T-junction box. It also has two 9-way female SUB-D connectors for connecting any device which connects to the bus by a PCMCIA card.
- 5 **TSX FP ACC 2/12:** 9-way female SUB-D connector for Fipway/Fipio connection using daisy chaining or tap link connection.
- 6 **TSX FP ACC 7:** line terminator to be placed at each segment end.  
**TSX LES 65:** terminal block for TSX Series 7 PLC, which performs the address coding.

### Performances

#### Fipio bus operating mode and performance on fiber optics

After configuration in Fipio mode, the processor scans the various application devices according to the software configuration:

- Image variables of the input values and of the output command values of a configured device are scanned as quickly as possible on the bus, whilst respecting the existing relationships between periods of different tasks which use these devices.
- Appearance or disappearance of a configured device is detected on the bus within a maximum time of 200 ms.
- Exchanges occur at the rate defined by the programmer, from 10 to 20 Uni-TE messages per second.

The network cycle time is double that of the electrical bus when OZD FIP G3 transceivers are used.

#### Fipway bus operating mode and performance on fiber optics

The operating principle is identical to that on an electrical network, in that the number of stations is limited to 32 and the transmission time is as follows:

- For the Common words and Shared Table services, updating of the entire database is carried out every 40 ms maximum.

For Uni-TE message handling, the network characteristics are used to transmit a maximum of 230 messages of 128 bytes per second.

### Characteristics (with OZD FIP G3 optic transceivers) (1)

Type of bus/network		Fipio bus	Fipway network
Structure	Type	Open industrial support conforming to Fip standard	
	Topology	In redundant rings or in a line with simple redundant links	
	Access method	Producer/consumer principle Management by a fixed arbitrator	Producer/consumer principle Management by an automatically elected arbitrator
Transmission	Mode	Multimode (860 nanometres)	
	Data rate	1 Mbit/s	
	Medium (2)	Fiber optic 50/125 - 17 dBm or 62.5/125 - 15 dBm	
	Inter-repeater distance	2,500 m for 50/125 and 2,800 m for 62.5/125	
Configuration	No. of connection points	32 optic transceivers	20 optic transceivers
	Maximum no. of devices	16 Fipio devices can be connected to the same fiber optic transceiver	16 stations can be connected to the same fiber optic transceiver but the maximum number of stations is 32
	No. of segments	The loop (or fiber optic line) is similar to a non cascable segment	
	Length	Maximum circumference of the ring (or length of the line): 20 km	
	Maximum optic distance between 2 OZD FIP G3 transceivers	1,500 m, with the following on the ring or the line: 32 optic transceivers 2,000 m, with the following on the ring or the line: < 32 optic transceivers 3,000 m, with the following on the ring or the line: 2 optic transceivers	
	Tap links	From the OZD FIP G3 fiber optic transceiver, the maximum length of the electrical tap link is 100 m	
Services		Same as page 4/56 except for the Telegram service, which is not available with OZD FIP G3 fiber optic transceiver.

# Modicon TSX Micro automation platform

## Fipio bus and Fipway network

### Cables

- 1 **TSX FP CA●00**: trunk cable, shielded twisted pair 150 Ω (8 mm diameter) for normal environments and use inside buildings.
- 2 **TSX FP CR●00**: trunk cable, shielded twisted pair 150 Ω and 1 x 1.5 mm<sup>2</sup> pair for remote supply (9.5 mm diameter) for harsh environments and use outside buildings.
- 3 **TSX FP CC●00**: tap link cable, shielded twisted pair 150 Ω (8 mm diameter) for normal environments and use inside buildings.
- 4 **TSX FP CG0●0**: tap link connecting cable for PCMCIA TSX FPP 10/20 communication card for TSX Micro/Premium/TSX Series 7 PLCs, FT 2100 terminals and PC compatibles. Connection to the bus is via a 9-way SUB-D connector on the TSX FP ACC3/ACC4 junction box.
- 5 **TSX FP CE030**: tap link connecting cable for TSX FPC 10 or FCP FPC 10 PC communication card (ISA bus) for FTX 517, CCX 77/87 terminals and PC compatibles. Connection to the bus is via a 9-way SUB-D connector on the TSX FP ACC 3/ACC 4 junction box.

### Connection boxes

- 6 **TSX FP ACC14**: Polycarbonate IP 20 junction box: provides tap link from the trunk cable to connect 1 device via TSX FP CC●00 tap link cable or several devices in a daisy chain.
- 7 **TSX FP ACC3**: IP 20 box for connecting 2 PC or PCMCIA cards (TSX FPP 10, TSX FPC 10, TSX FPP 20/200, FCP FPP 10) on a 9-way SUB-D connector.
- 8 **TSX FP ACC4**: IP 65 junction box. It also has a 9-way female SUB-D connector for any device which is connected to the bus via a PCMCIA card (in this case, the box is IP 20).  
**TSX EF ACC99**: IP 65 junction box for IP 67 I/O modules, consult our Modicon Premium automation platform catalogue.

### Connectors

- 9 **TSX FP ACC2** and **TSX FP ACC12**: 9-way female SUB-D connector for Fipway/Fipio connection (TSX FP ACC 2 connector for TSX 17 20 micro-PLC for example). Used for daisy chain or tap link connection (90° output high or low, 45° output high or low).
- 10 **TBX BLP01**: connector for TBX I/O modules (IP 20).
- 11 **TSX LES65**: connecting cable for TSX/PMX model 40 PLCs. Used for address coding.
- 12 **TSX FP ACC6**: electrical repeater: used to increase the number of stations (max 64) and the length of the network by creating an additional segment of up to 1000 m (a maximum of 4 repeaters in cascade giving a network length of 5000 m).  
**TSX EF C●●●**: dust and damp proof connectors for IP 67 I/O modules, consult our Modicon Premium automation platform catalogue.

### Other elements

- 13 **TSX FP ACC8M**: fibre optic/electrical repeater: used to connect electrical segments via a fibre optic link (particularly suitable for zones with a high level of interference) or to connect a fibre optic device.
- 14 **TSX FP ACC7**: Line terminator, to be installed at both ends of a segment.
- 15 **TSX FP JF020**: fibre optic jumper (length 2 m). For fibre optic connection of the TSX FP ACC 8M repeater to a patch panel. The maximum length of the fibre optic cable (62.5/125) between 2 repeaters is 3000 m.  
**TSX EF ACC7**: line terminator, to be installed at both ends of a segment requiring IP 67 protection, consult our Modicon Premium automation platform catalogue.  
**TSX FP ACC9**: network wiring test tool. This is used for testing the continuity of segments, the connections of the various devices and the installation of line terminators.

(1) The characteristics and performances of the Fipio bus/Fipway network are dependent on the above TSX FP accessories being used.

(2) Normal environment:

- without special environmental restrictions,
- operating temperature between + 5 °C and + 60 °C,
- fixed installations.

(3) Harsh environment:

- resistance to hydrocarbons, industrial oils, detergents, solder chips,
- up to 100% humidity,
- saline environment,
- extreme variations in temperature,
- operating temperature between - 10 °C and + 70 °C,
- mobile installations.

(4) Mobile installations: cables as per VDE 472, part 603/H:

- for use on cable drag chain with minimum bend radius of 75 mm,
- for use on gantry crane (strikethrough: portal support), subject to compliance with conditions for use such as acceleration, speed, length etc: contact our regional branch office for further information.
- not authorized for use on robots, or multi-axis applications.

Presentation

The Uni-Telway bus is a standard means of communication between control system components (PLCs, MMI terminals, supervisors, variable speed drives, numerical controllers, weighing equipment, etc.).

It is suitable for architectures designed to manage control and monitoring devices via a PLC, or architectures used for MMI (supervision, etc.).

The Uni-Telway bus requires a master station which manages the allocation of bus access rights to the various connected stations (known as slave stations).

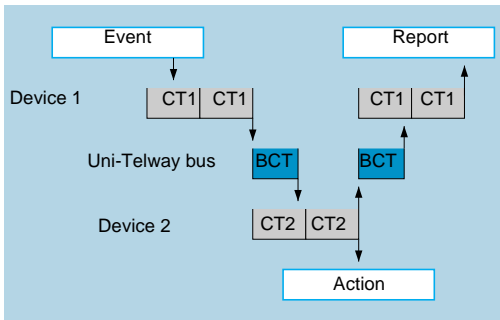

Characteristics

Physical interface		RS 485 non isolated terminal port (TER/AUX)	Premium RS 485 isolated module integrated port (1)	Isolated RS 485/RS 422 PCMCIA card	20 mA CL PCMCIA card	Non-isolated RS 232D PCMCIA card
Structure	Type	Heterogeneous industrial bus				
	Link	Multidrop				Point-to-point
	Method of access	Master/Slave principle				
Transmission	Mode	Asynchronous transmission in baseband				
	Data rate	1.2...19.2 Kbit/s				0.3...19.2 Kbit/s
	Medium	Shielded double twisted pair				
Configuration	Number of devices	5 max.	28 max.		16 max.	2
	Number of connection addresses	8 max.	96 max.(1 device can occupy several datalink addresses)			
	Length of bus	10 m max., 1,000 m with TSX P ACC 01	1,000 m max. excluding tap links		1300 m max., excluding tap links	15 m (unlimited via modem)
	Tap links	–	20 m	20 m	15 m	–
Service	Uni-TE	Point-to-point requests with confirmation (question/response), of up to 240 bytes (2) initiated by any connected device				
		Unsolicited point-to-point data, without confirmation, of up to 240 bytes(2) initiated by any connected device				
		Broadcast messages of up to 240 bytes (2) initiated by the master device				
	Other functions	Transparent communication, via the master, with any device in an X-Way architecture				
		Diagnostics, debugging, adjustment and programming of PLCs				
	Security	Check character on each frame, acknowledgement and, if required, repetition of messages ensure security of transmission				
	Monitoring	Bus status table, transmission error counters and device status can be accessed by program in each device				
		Status of the bus and devices connected from the master PLC accessible using PL7 software.				

(1) TSX SCY 21601 single format module.  
(2) Limited to 128 bytes with TSX Micro/Premium PLC terminal port.

### Performances

BCT = Uni-Telway bus cycle time  
CT1 = Device 1 bus cycle time  
CT2 = Device 2 bus cycle time

The Uni-Telway bus cycle time depends on:

- The number of devices polled (datalink addresses).
- The data rate.
- The turnaround time of each device.
- The number, length and type of messages.

**BCT** = Bus Cycle Time, is the interval between two polls from the same device.

The curves opposite give the Uni-Telway cycle time as a function of the number of slaves operating at 9.6 Kbit/s or 19.2 Kbit/s, with a typical turnaround time of 5 ms per device (excluding messages).

The following table shows the time to be added (in ms) to the true BCT value as a function of the traffic (N = Number of usable characters):

Exchanges	Time (ms)	
	at 9.6 Kbit/s	at 19.2 Kbit/s
Master to slave	$24 + 1.2 N (1)$	$17 + 0.6 N (1)$
Slave to Master	$19 + 1.2 N (1)$	$12 + 0.6 N (1)$
Slave to slave	$44 + 2.3 N (1)$	$29 + 1.15 N (1)$

In a distributed control system architecture the application-to-application response time depends not only on the communication system, but also on:

- The processing times of the message source and destination devices.
- The degree of asynchronism between the bus and processor cycle times.

This response time must be evaluated by the designer of each application according to the devices which are connected.

The processing time of a device may vary from one to two cycle times depending on the degrees of asynchronism.

### Description

#### TSX Micro/Premium PLCs

TSX Micro

Premium

TSX SCY 21601

TSX Micro/Premium PLCs provide various ways of connecting to the Uni-Telway bus.

- By integrated TSX Micro/Premium processor or Atrium coprocessor port**  
The AUX port (2) (8-way mini-DIN) has one non-isolated RS 485 serial link channel (maximum distance 10 m).
- By TSX SCY 21601 integrated port for Premium PLC or Atrium coprocessor**  
This module has one Half-duplex isolated RS 485 serial link channel, which is multiprotocol, including Uni-Telway.
- Via multiprotocol PCMCIA card**  
A slot on the TSX 37 21/22/Premium PLC processors, the Atrium coprocessor and the TSX SCY 21601 module (3) accepts the following multiprotocol cards:

- TSX SCP 114 PCMCIA card  
Isolated RS 485/RS 422 link. This type of card corresponds to the Uni-Telway standard.
- TSX SCP 111 PCMCIA card  
Non isolated RS 232D link. This type of card can be used for direct point-to-point links or via Modem.
- TSX SCP 112 PCMCIA card  
20 mA current loop link. This type of card is used for a multidrop link (2 to 16 devices) and requires a 24V external power supply.

(1) N = Number of usable characters corresponding to the messages to be exchanged.

(2) TER port for TSX 37 05/08/10 PLC.

(3) This slot can also accept the TSX FPP 20 PCMCIA card for Fipway networks, or the TSX JNP 112/114 PCMCIA card for JNet networks.

# Modicon TSX Micro automation platform

## Uni-Telway bus

### Uni-Telway bus wiring system

- 1 **TSX CSA ●●●**: bus cable, double shielded twisted pair. The shielding must be connected to the earth of each device.
- 2 **TSX SCA 50**: passive T-junction box, matches the impedance when it is installed at the end of the line.
- 3 **TSX SCA 62**: passive 2-channel Uni-Telway subscriber socket, is used for coding the address of two connected devices, and matching the impedance when it is installed at the end of the line.
- 4 **TSX SCA 60/61**: passive terminal block, used for intermediate devices that have a 15-way female SUB D connector:
  - TSX SCA 60 used for intermediate devices,
  - TSX SCA 61 used for end devices.
- 5 **TSX P ACC 01**: connection box, used for connecting a TSX Micro/Premium PLC to the Uni-Telway bus via the PLC terminal port. The connecting cable (length 1 m) is integrated in the connection box. It isolates the signals (for distances > 10 m) and is used to match the end of line impedance. It is also used to set the operation of the terminal port (Uni-Telway Master/Slave or character mode).
- 6 **TSX LES 64/74**: cable connectors for extensions to the Uni-Telway bus, used to connect TSX model 40 PLC processors that have an integral Uni-Telway port as standard. They are used for coding the address of the connected device.
- 7 **TSX SCP 114**: PCMCIA card for connecting TSX Micro (1)/Premium PLCs to the Uni-Telway bus.
- 8 **TSX SCP CU 4030**: Uni-Telway connecting cable between the TSX SCP 114 PCMCIA card (on TSX P57 ●0M processor or TSX SCY 21601 module) and the TSX SCA 50 junction box.
- 9 **TSX SCY CU 6530**: Uni-Telway connecting cable between the TSX SCY 21601 module integrated channel and the TSX SCA 62 subscriber socket.
- 10 **XBT-Z908**: Uni-Telway connecting cable between the CCX 17 and the TSX SCA 62 subscriber socket.
- 11 **TSX PCX 1031**: universal connecting cable between a PC compatible (COM port, 9-way SUB D connector) and the TER or AUX port for TSX Micro/Premium PLCs or the TSX P ACC 01 connection box (8-way mini-DIN connector).
- 12 **TSX CSC 015**: connecting cable between the TSX 17 micro-PLC (via a TSX 17 ACC 5 adaptor or a TSX SCG 1161 module) and TSX SCA 62 subscriber socket.

**TSX DG UTW F**: this manual describes the operating principles and the architectures of the Uni-Telway bus. It is required for setting up and installing the Uni-Telway bus.

**TSX DR NET F**: this manual describes the X-Way architectures, services and address mechanisms. It includes the coding of Uni-TE requests as well as precautions for connecting earths for the networks. It also includes the principles of asynchronous serial transmission.

### Uni-Telway bus connection accessories

Description	Use	Addr.	Reference	Weight kg
Terminal port connection box	Isolation of Uni-Telway signals for bus length > 10 m, end of line adaptation, bus cable tap links. Supplied with cable (1 m length) equipped with a mini-DIN connector (TER or AUX ports)	5	TSX P ACC 01	0.690
Passive T-junction box	Tap link and extension of bus cable,	2	TSX SCA 50	0.520
Passive 2-channel subscriber socket	2-channel tap link (15-way female SUB-D connector) and extension of bus cable, address coding and end of line adaptation	3	TSX SCA 62	0.570
Active adaptation box RS 232C/RS 485	Connection of an RS 232C device active adapter unit (using Uni-Telway protocol), adaptation and isolation of signals, end of line adaptation (no address coding)	—	TSX SCA 72	0.520

### Uni-Telway bus connecting cables (3)

On-Telway bus connecting cables (%)						
Description	Use		Addr.	Length	Reference (1)	Weight kg
	From	To

		TSX SCA 62 sub. sock.	9	3 m	TSX SCP CU 6530	0.200
RS 232 terminal port/peripheral device connecting cable	TSX Micro/ Premium or Atrium port or TSX P ACC 01 box (TER or AUX)	RS 232D port for 9-way SUB D type PC compatible	11	2.5 m	TSX PCX 1031	0.170
		USB port of PC	—	2.5 m	TSX PCX 3030	—

(1) Product supplied with bilingual Quick Reference Guide: English and French.

(2) Type III PCMCIA type III slot for TSX SCP 111/112/114, TSX FPP 20 or TSX JNP 112/114● card

(3) For information on other connection cables, please see page 4/64.

4

Presentation

TSX Micro/Premium PLCs provide, via their processor, coprocessor or TSX SCY 21601 communication module, several possible ways for exchanging data in character mode with devices equipped with an asynchronous serial link interface:

- RS 485 integrated port.
- Type III PCMCIA card with RS 232D, RS 485 (RS 422 compatible) or 20 mA current loop link.

Protocols supported are character mode (ASCII), Uni-Telway and Modbus. Other protocols are also available, or can be developed on request, on a RS 485 or RS 232D link, which enables TSX Micro/Premium PLCs to communicate on third-party architectures. These products are offered within the framework of the Schneider Alliances partnership programme. The list of modules available can be obtained from your Regional Sales Office, or from our Internet site [www.schneideralliances.com](http://www.schneideralliances.com).

Description

Integrated links

- 1 Via integrated port on the processor or coprocessor**  
The AUX (1) port (8-way mini-DIN connector) has one non-isolated RS 485 serial link channel (maximum distance 10 m).
- 2 Via integrated port on the TSX SCY 21601 module**  
This module for Premium PLCs has one isolated RS 485 serial link channel (25-way SUB-D connector). Half duplex multiprotocol, including Uni-Telway.

TSX SCP 11● multiprotocol PCMCIA cards

- 3** A slot on the processor, coprocessor and on the TSX SCY 21601 module takes cards which comprise:
- 4** A removable cover with fixing screws for access to the 20-way miniature connector.
- 5** Two indicator lamps:
- ERR lamp: card or link fault,
  - COM lamp: data transmission or reception.
- Connector cable to be ordered separately:  
TSX SCP C● ●●● cable.
- (1) TER port for TSX Micro TSX 37 05/08/10 PLC.

Characteristics

Type		Non isolated RS 485 terminal port	Isolated RS 485 TSX SCY 21601 integrated port (1)	PCMCIA cards RS 232D	PCMCIA cards RS 485 RS 422 Compatible	PCMCIA cards 20 mA current loop (3)
Physical layer	Data rate	1.2...19.2 Kbit/s (2)	1.2...19.2 Kbit/s	0.3...19.2 Kbit/s	1.2...19.2 Kbit/s	
Transmission	Size	120 characters		4096 characters max.		
	Data	7 or 8 bits

# Modicon TSX Micro automation platform

## PL7 Micro/Junior/Pro programming software

To meet the evolving hardware and software needs of our customers, Schneider Electric introduces PL7 version 4.4 programming software for the Modicon TSX Micro and Modicon Premium platforms.

### Modicon TSX Micro automation enhancements

TSX CPP 110

#### CANopen connectivity

Micro TSX 37 21 and 37 22 PLC communications are enriched with the addition of a CANopen machine bus, made possible through the use of a PCMCIA card equipped with a cable (length 0.5m) and a tap junction (with 9-way SUB-D connector). This **TSX CPP 110** kit allows a direct link to the bus and ensures the role of the master on the CANopen bus. The PCMCIA card is inserted into the reserved communication card slot that is available on the TSX 37 21 and TSX 37 22 CPU.

#### Extension memory size

In order to extend the memory of existing applications or to create more complex applications, the memory capacity of TSX 37 21/22 PLCs can be extended from 64 Kwords to 128 Kwords (program and constants). The CPU bases are capable of receiving 3 different memory cards:

- 128 Kwords application RAM memory TSX MRP 0128P.
- 128 Kwords application Flash EPROM memory TSX MRF 0128P.
- 128 Kwords application and 128 Kwords data storage RAM memory TSX MRP 2128P.

#### SyCon configuration software for CANopen machine bus

A version of PL7 Micro programming software (1-station) is available with SyCon configuration software for the CANopen machine bus (reference TLX CD PL7M PC44M).

### Modicon TSX Premium automation enhancements

TSX CSY 164

TSX WMY 100

#### CANopen connectivity

- The Premium TSX P57 103M low-end processor has CANopen machine bus connectivity via the use of the new **TSX CPP 110** PCMCIA card (see "CANopen connectivity" for TSX Micro platform, above). This new card is compatible with all Premium processors and Atrium coprocessors (except TSX P57 153M processor with embedded Fipio bus link).

#### New application-specific modules:

- **TSX CSY 164** SERCOS motion control module. PL7 version 4.4 Junior/Pro software makes it possible for this module to individually declare the 16 channels as real axes, imaginary axes or remote axes. This new 16-channel module is in addition to the current **TSX CSY 84** module with 8 real axes.
- **TSX WMY 100** FactoryCast HMI Ethernet module. This new Ethernet TCP/IP module with embedded Web server offers additional HMI web services compared to current modules (TSX ETH 110WS/4103/5103). New features include acquisition of PLC data in the HMI database of the module, Email with automatic messaging on events, math and logic functions, and connection to relational databases.

### PL7 Micro Junior/Pro software version 4.4 software enhancements

PL7 version 4.4 enables new TSX Micro/Premium modules to take advantage of additional functionalities:

- PL7 software registrations by the Internet, electronic mail, fax or phone (obligatory registration before 22nd day).
- Change in the Fipio catalogue for Momentum distributed I/O.
- Transfer of PL7 user rights between PCs via floppy disk or network.
- Enriched export files of the data application (FEF) for better compatibility with Unity software after migration.

PL7 Micro Junior/Pro software packages are offered according to two alternatives depending on the type of PLCs/PC cable: connection on the RS 232C port, or the USB port of a PC.

# Modicon TSX Micro automation platform

## PL7 Micro/Junior/Pro programming software

### Presentation

PL7 Micro/Junior/Pro software packages are designed for Windows 2000 Professional and Windows XP (1) operating systems and therefore benefit from all the facilities relating to these:

### Ergonomics of the software

More user-friendly and productive ergonomics thanks to:

- Access to contextual menus by right-clicking with the mouse for fast access to the services available for the selected object.
- Contextual help: direct access to help corresponding to the selected object.
- Tool tips: explanatory messages appear when skimming over the toolbar buttons.

Furthermore, some important functions make the software easier and safer to use:

### Multi-instance

The multi-instance function enables several applications to be worked on simultaneously.

This function enables:

- Several different applications present on the PC to be opened in offline mode in order to check or copy data.
- Debugging of two (or more) applications on two PLCs present on the same network in on-line mode. This is particularly useful when debugging inter-PLC communication functions.

5

### Management of access rights

Use of the various PL7 software functions can be limited and controlled by managing the access rights.

There are 5 user profiles (differentiated by passwords) which characterize the functions available to users on the programming terminal. The profiles range from read-only access to an application (lowest profile) to full programming (profile with the most rights).

### Application server

PL7 Pro software can be launched in OLE Automation server mode from a third-party client application. In this case, certain PL7 program functions can be executed following commands sent by an OLE client application. This instance of the program then no longer reacts to commands from the operator keyboard. Server mode can be launched in offline mode (COM) if both programs are on the same machine, or in remote mode (DCOM), if the programs are installed on different machines.

The commands available are as follows:

- Manage an execution context (open/close an application, modification of the address and driver of the connected PLC; PLC status).
- Control the PLC (connection/disconnection, send a RUN/STOP/INIT command, program uploading/downloading).
- Read data (application or symbol export only in source format, read symbol/comment associated with an address, read application identity).

(1) However, compatibility with the Windows 95 operating system is no longer provided and USB port is not compatible with Windows 95 and Windows NT 4.0.

# Modicon TSX Micro automation platform

## PL7 Micro/Junior/Pro programming software

### Application creation and debug tools

#### Application browser (conventional view)

Access to all programming and debug tools is gained via the application browser. This gives a global view of the program and enables all the application components to be accessed quickly via contextual menus.

- 1 Configuration editor.
- 2 Program editor.
- 3 DFB user function block editor.
- 4 Variable editor.
- 5 Animation table editor.
- 6 Documentation editor.
- 7 Operating screen editor.

#### Concept of sections and Grafcet enhancement

In order to make programs more comprehensible, the FAST and MAST tasks are split into sections.

Each section **1** has a name, a comment and is programmed in one of the four languages available in PL7.

A section programmed in Grafcet language can contain a main chart **2** and macro-steps **3**. Version ≥ V4.0 of PL7 allows comments to be added to each macro-step.

To protect intellectual property or avoid any unwarranted modification, each section can be write-protected or read/write-protected.

#### Function views of an application

PL7 Pro software can be used to structure an application for a Premium platform into functional modules that are broken down into sections (program code), animation tables and operating screens. Independently of the multitask structure of the PLC, the designer can define a multilevel tree structure of the automation application.

At each level, it is possible to attach program sections written in Ladder language (LD), Structured Text (ST), Instruction List (IL), Grafcet (SFC), and animation tables.

Two types of view are available at all times:

- A representation showing a tree structure of modules can provide a breakdown according to consistent functions in relation to the process to control.
- The classic representation of the application browser provides a view of the execution order of the program sections for each PLC.

The operation services associated with the functional view are available in one or the other view. In particular, a single command can be used to force whether or not a functional module is executed.

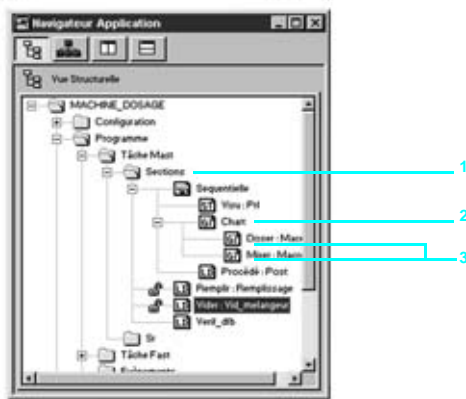

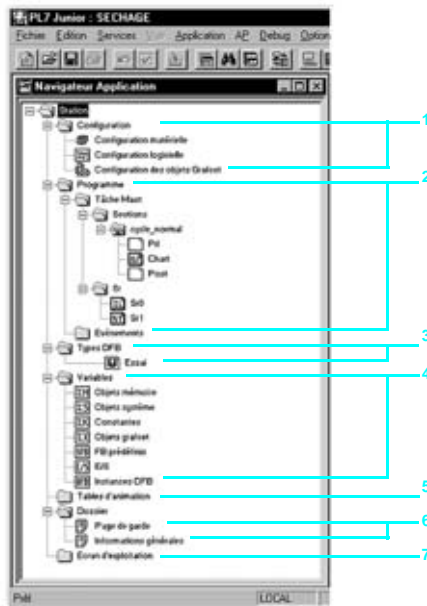

In this case, every section attached to the functional module is automatically forced.

#### Exporting/importing functional modules

All or part of the tree structure can be exported into functional modules.

In this case, all program sections of the different module levels are exported.

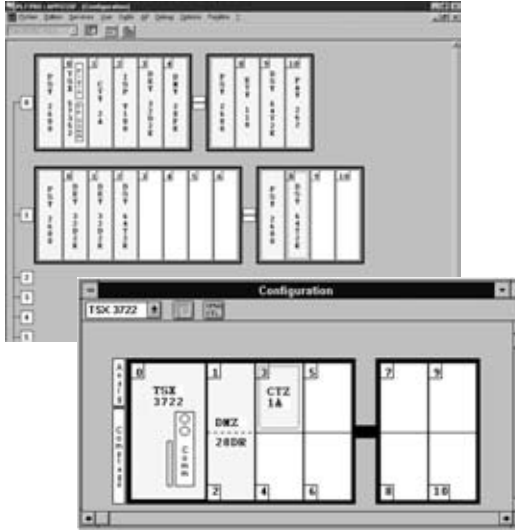

During an import, an assistant can be used to reassign the data associated with the module in stages.

# Modicon TSX Micro automation platform

## PL7 Micro/Junior/Pro programming software

### Configuration editor

#### Hardware configuration

The configuration editor intuitively and graphically enables the declaration and configuration of the various components of the TSX Micro/Premium PLC application:

- Processor, coprocessor.
- Tasks.
- Application-specific I/O modules.
- Memory.
- ...

By clicking on an unconfigured position, the display of a dialog box shows the available I/O modules, classed according to family.

Once the various modules are positioned, selecting them accesses parameter entry for each module.

#### Software configuration

The configuration editor can also be used to set the software parameters of the application: choice of the number of constants, number of internal words and the number of each type of function block.

The configuration editor provides access to parameter entry for the function blocks. The copy/paste function for these parameters is available from version ≥ V4.0 of the PL7 software onwards.

#### Configuration of Grafcet objects

When programming in Grafcet language, the configuration editor can define Grafcet objects (steps, macro-steps, etc.) and execution parameters (number of steps and active transitions).

#### Setup of application-specific functions

A number of tools are provided as standard for setting up the various applications: discrete I/O, analog I/O, counting, motion control (1), man-machine interface (MMI), communication, weighing (1), Warm Standby redundancy (2).

The parameter screens for the application-specific functions are accessed from the I/O configuration screen by clicking on the position in which the module has been defined.

The screens enable the main operating characteristics of the chosen application to be defined, for example:

- Filter values for discrete I/O.
- Voltage or current range for analog I/O.
- Threshold values for counting.
- Path of axes for position control.
- Calibration change during weighing.
- Transmission speed for communication.

(1) PL7 Junior/Pro function available on a Premium platform.

(2) PL7 Junior/Pro function available on a Premium platform based on a TSX P57 353/453 processor (version with integrated Fipio link).

Software structure

PL7 Micro/Junior/Pro software offers two types of structure:

- Single task: this is the simplified structure offered by default, where a single master task consisting of a main program, comprising several sections and subroutines, is executed.
- Multitask: this structure, which is better suited to high-performance real-time applications, consists of a master task, a fast task and event-triggered tasks, which have the highest priority. Master and fast tasks are divided into sections.

Structured and modular programming

PL7 program tasks comprise several parts called sections and subroutines. Each section can be programmed in the appropriate language for the processing to be carried out. Such division into sections enables a structured program to be created and program modules can easily be generated or added.

Subroutines can be called from any section of the task to which they belong or from other subroutines in the same task.

Simple task software structure

There are two types of cyclic execution:

- Normal cyclic execution. This is the default option.
- Periodic execution. This type of execution, as well as the period, are selected by the user during configuration.

Normal execution (cyclic)

At the end of each scan, the PLC system launches the execution of a new scan. The execution time of each scan is monitored by a software watchdog whose value is defined by the user.

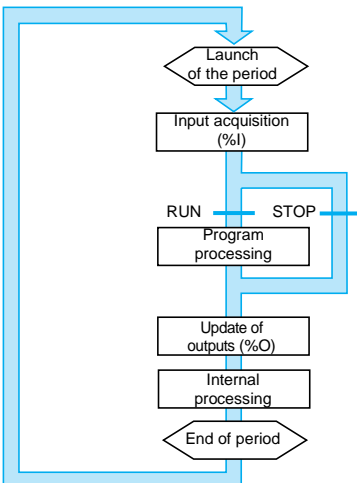

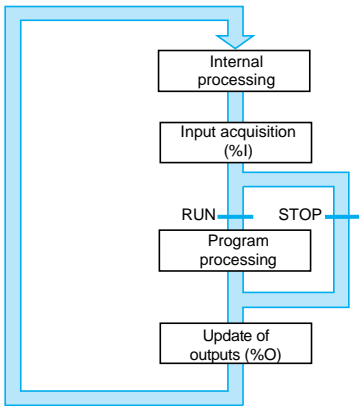

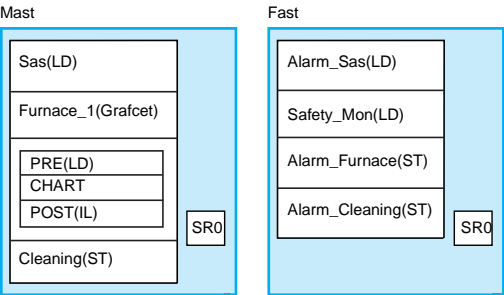

In the event of overrun, a fault occurs causing:

- The scan to stop immediately (STOP).
- A display on the front panel of the PLC.
- The alarm relay of the main rack power supply to be set to 0.

Periodic execution

A new scan is executed at the end of each period. The execution time of the scan must be less than the time of the period defined (1 to 255 ms). In the event of overrun, the latter is stored in a system bit (%S19), which can be set to 0 by the user (by program or by the terminal).

A software watchdog which can be configured by the user monitors the scan time. In the event of overrun, an execution fault is signaled (see normal execution).

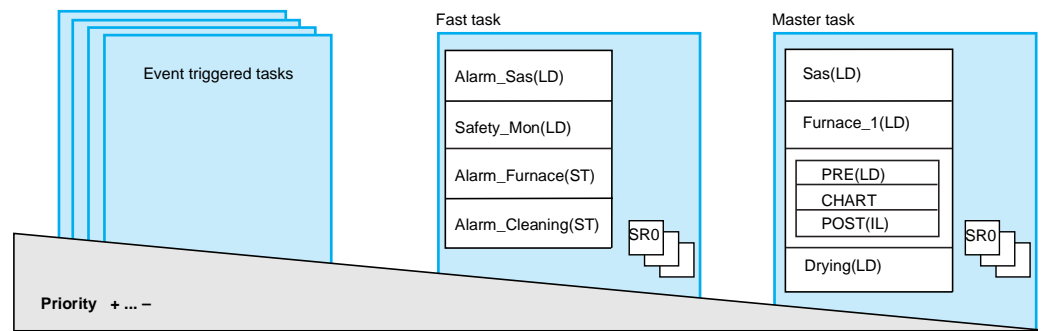

### Multitask software structure

PL7 Micro/Junior/Pro software offers a Multitask software structure, consisting of:

- A master task (divided into sections, one of which may contain Grafcet).
- A fast task (divided into sections).
- One or more event-triggered tasks (only one section per task).

These tasks are independent and are executed in "parallel", with the PLC processor managing the execution priority. When an event occurs, or at the start of the fast task cycle:

- The current execution of lower priority tasks is stopped.
- The event-triggered task or the fast task is executed.
- The interrupted task takes over again when processing of the priority task is completed.

This structure can optimize use of the processing power, and can be used to structure the application and simplify design and debugging, as it is possible to write and debug each task independently of the others.

### Master task

This compulsory task, which executes the main program, is periodic or cyclic (see single task structures). It is activated systematically. It is intended for sequential processing. Each section can be programmed in Ladder, Structured Text or Instruction List language. One section is dedicated to Grafcet language; when this language is chosen, 3 processing operations are proposed:

- Preliminary processing (PRE) is programmed in Ladder, Structured Text or Instruction List language and processes initializations on power return, operating mode modifications, input logic.
- Sequential processing (CHART) includes the graphic transcription and management of Grafcet charts. It provides access to processing of the actions and transition conditions.
- Post-processing (POST). This is programmed in Ladder, Structured Text or Instruction List language and is used to process all the instructions from the 2 preceding processing operations and the indirect safety functions specific to the outputs.

### Fast task

This task, which is higher priority than the master task, is periodic in order to leave time for execution of the lower priority task. Processing operations in this task must be as short as possible so as not to adversely affect the master task. It is useful when fast periodic changes in discrete inputs need to be monitored.

Each section of this task can be programmed in Ladder, Structured Text or Instruction List language.

### Event triggered tasks

Unlike the tasks described above, these tasks are not linked to a period. Their execution is triggered by an event occurring in an application-specific module (eg.: overrun of a counter threshold, change in state of a discrete input). These tasks have higher priority than all other tasks, and they are therefore suitable for processing operations requiring very short response times to the occurrence of an event. They can be programmed in Ladder, Structured Text or Instruction List language.

#### Number of EVTi control events:

- TSX Micro PLCs: 8 events with TSX 37 10 and 16 events with TSX 37 21/22.
- Premium PLCs: 32 events with TSX 57 10 and 64 events with TSX 57 20/30/40 and PCX 57 20/30.

TSX Micro TSX 37 21/22 and Premium PLCs have 2 priority levels (EVT0 event has priority over other EVTi events).

## Ladder language (LD)

### Program structure (section, SR or event-triggered task)

Programs written in Ladder language consist of a series of rungs which are executed sequentially by the PLC. Each rung may be:

- Identified by a label.
- Completed by a comment of up to 222 characters.

A rung consists of 7 lines on TSX Micro and 16 lines on Premium, with 11 columns, allowing a maximum of 10 contacts and one coil per line.

### Program editor: Ladder language

The Ladder language editor offers several tools for constructing rungs in a user-friendly way:

- A palette of graphic elements for direct access to the various graphic symbols of the language via the mouse or the keyboard: contacts, Boolean logic, coils, operation blocks, predefined function blocks...

- A rung can be drawn without having to fill in each element.
- The language objects can be entered and displayed in either symbol or address format.
- The symbol and address of each object can be displayed simultaneously.
- A rung is constructed simply by selecting the symbol from the graphic palette and placing it in the correct position in the grid on-screen.
- An automatic link line function optimizes the number of user actions.

The Ladder language editor is used to call up immediately the functions which assist data entry:

- Access to function libraries.
- Access to the variables editor.
- Cut, copy, paste.

## Structured Text language (ST)

Structured Text language is a sophisticated algorithmic type language which is particularly suitable for programming complex arithmetic functions, table operations, message handling, etc.

### Program structure (section, SR or event-triggered task)

Structured Text language enables direct transcription of a flowchart analysis and is organized into statements. Each statement consists of a label (1000 labels max), comments (256 characters max) and instructions.

There are four methods for controlling statements:

- Conditional action IF.
- Conditional iterative action WHILE (action repeated while a condition is true).
- Conditional iterative action REPEAT (action repeated until a condition is true).
- Repetitive action FOR (action repeated a certain number of times).

### Program editor: Structured Text language

The editor enables statements to be entered one after another.

The editor provides help with entering:

- Modifications, insertion, etc.
- Cut, copy, paste.

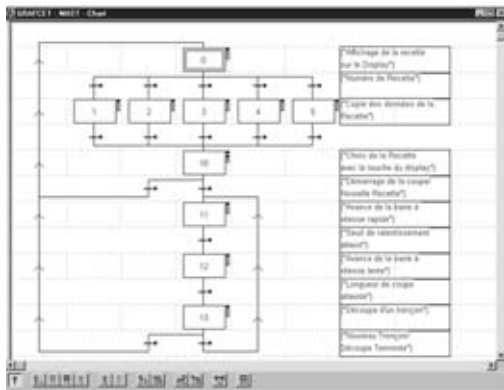

Objects can be entered and displayed in either symbol or address format.

Different colors are used for the objects, language key words and program comments to make it easier to read.

```
ST: MAST - SHS
(* Test: Preselection Effectue => INIT Donnees PRESS *)
IF N12 0.1 THEN
  NQ4 2 -> FALSE;
  NQ2 0.21 -> TRUE;
  NQ3 -> FALSE;
  NQ2 1.1 -> FALSE; (* Preselection Directe V1 *)
ELSE

IF N12 1.2 THEN
  NQ2 1.22 -> TRUE;
```

TSX Micro PLC	Premium PLC
<ul style="list-style-type: none"> <li>■ 96 steps maximum on 8 pages for TSX 37-10 and 128 steps for TSX 37-21/22</li> <li>■ 1024 transitions maximum</li> <li>■ 11 elements maximum per divergence/convergence</li> </ul>	<ul style="list-style-type: none"> <li>■ maximum of 250 steps on 8 pages</li> <li>■ 64 macro-steps of 250 steps.</li> <li>■ A "generic" comment can be associated with each macro-step</li> <li>■ 1024 transitions maximum</li> <li>■ 11 elements maximum per divergence/ convergence</li> <li>■ 1024 steps maximum in the application</li> </ul>

## Grafcet language (SFC)

Grafcet language is used to describe, in a simple and graphic manner, the sequential part of control systems. It corresponds to the SFC "sequential function chart" language described in standard IEC 1131-3.

### Structure of the section in the master task

Grafcet SFC language is only used in one section of the master task.

This is structured in three processing operations, see page 5/8.

Programs written in Grafcet SFC language consist of:

- Macro-steps (1) which are the only representation of a set of steps and a transition.
- Steps, with which the actions to be executed are associated.
- Transitions, with which the conditions are associated (transition conditions).
- Directed links, connecting the steps and transitions.

See characteristics page 5/16.

The actions (continual, pulsed on activation or deactivation) and transition conditions can be programmed in the desired language: Ladder, Structured Text or Instruction List.

### Program editor: Grafcet SFC language

The editor offers 8 pages, each consisting of 11 columns and 14 lines, giving 154 cells per page.

A palette of graphic objects is used for direct access to each graphic symbol (macro-steps, steps, transitions, sequence selection, simultaneous activation/deactivation and connectors).

Programming of the transition conditions and actions is performed simply by clicking on the required chart element.

On a Grafcet page, comments of up to 64 characters can be entered in any cell.

Functions which assist entry: cut, copy, paste, etc. are available to the user.

## Instruction List language (IL)

Instruction List language is a language representing, in the form of text, the equivalent of a Ladder diagram. It is used for writing Boolean equations and making use of the functions available in the language.

### Program structure (section, SR or event-triggered tasks)

A program in Instruction List language comprises a sequence of instructions from the following different families:

- Bit instructions, for example read input n° 3: **LD %I1.3**.
  - Instructions on function blocks, for example start timer n° 0: **IN %TMO**.
  - Numerical instructions on single, double and floating point integers, for example, perform an addition: **[%MW10:= %MW50 + 100]**.
  - Instructions on word tables, character strings, for example, perform an assignment: **[%MW10:10:=%KW50:10]**.
  - Program instructions, for example, call subroutine n° 10: **SR10**.
- Each instruction is composed of an instruction code and a bit or word type operand.

### Program editor: Instruction List language

As in Ladder language, instructions are organized into sequences of instructions (equivalent to a rung). Each sequence of instructions can be identified by a label %Li, with i being from 0 to 999 and accompanied by a comment of 222 characters maximum.

Each sequence of instructions is composed of one or more test instructions. The result of these instructions is applied to one or more action instructions.

Objects can be entered and displayed in either symbol or address format.

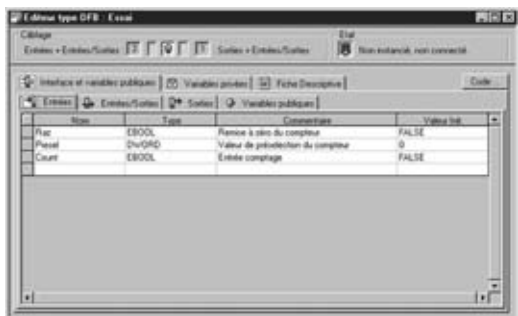

The editor provides help with entering data.

(1) With Premium PLCs only.

# Modicon TSX Micro automation platform

## PL7 Micro/Junior/Pro programming software

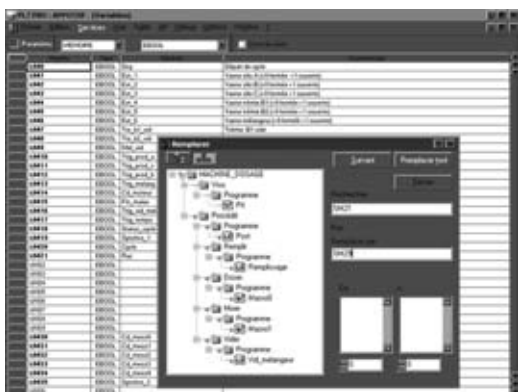

### Functions

#### User DFB function blocks

PL7 Pro software offers the user the possibility (for Premium PLCs) of creating their own function blocks which meet the particular needs of their applications. Once they have been created in the library, these function blocks can be used with PL7 Junior/Pro software.

These user function blocks enable an application to be structured. They are used as soon as a program sequence is repeated several times in the application or to freeze a standard type of programming. They can be exported to all other PL7 applications. Using a DFB function block in one or more applications enables:

- Simplification of program entry and design.
  - Improved program readability.
  - Easier debugging (all variables handled by the DFB function block are identified on its interface).
  - Use of DFB-specific internal variables (independent of the application).
- A DFB derived function block is set up in three phases:
- Design of the DFB which has a name, parameters (I/O), variables and code in Structured Text or ladder language.
  - Creation of a DFB instance in the variables editor or when calling the function in the program editor.
  - Using this instance in the program in the same way as a standard function block.

#### Variables editor

The variables editor is used to:

- Symbolize the various application objects (bits, words, function blocks, I/O, ...).
- Define the parameters of the predefined function blocks (timers, counters, registers etc.).
- Enter the values of the constants and select the display base (decimal, binary, hexadecimal, floating point, message).
- Define the DFB user function block parameters.

Each symbol (32 characters max, accented characters are permitted) can be accompanied by a comment (508 characters max).

Editing services are available in the editor:

- Find/replace an object in a part of the program or in a set of function modules (PL7 Pro).

- Find a character string in a list of symbols or comments.

Version ≥ V4.0 of PL7 offers enhanced functions due to:

- Copy/paste function for one or more symbol(s) and comments.
- Display in plain language of the overlap of different types of variable on a single memory address (for example, single and double format internal words, %MW0/%MD0).
- Highlighting of objects used by the application program.
- Opening the application variable database to third-party tools by importing/exporting text files (.txt). This new function makes it possible to create/modify application databases using a third-party software (for example TSX Microsoft Excel) that has extended edit functions.

#### Animation table

Tables containing the application variables to be monitored or modified can be created by entering them or automatically initialized from the selected phrase or rung.

Variables can then be:

- Modified.
- Forced to 0 or 1 for bit objects.

For each numerical variable, it is possible to select the display base (decimal, binary, hexadecimal, floating point, ASCII message).

Version ≥ V4.0 of PL7 offers new options for animation tables:

- Display of the comment associated with variables.
- Assignment of a single value to a number of variables.
- Change of display format for a number of variables.
- Display of the list of forced bits.

# Modicon TSX Micro automation platform

## PL7 Micro/Junior/Pro programming software

### Documentation editor

The documentation editor is built around the Documentation Browser which displays the contents of the documentation file in a tree structure.

It can be used to print all or part of the application documentation file on any graphic printer which can be accessed in Windows and uses True Type technology, in A4 or US letter print formats.

The documentation editor is used to define:

- A title page, including the name of the designer and project.
- General information pages.
- A footer.

The documentation editor automatically generates:

- The contents.
- The application documentation file: hardware and software configuration, program with its comments (including those relating to the macro-steps and subroutines).
- The list of variables sorted by address or symbol.
- The cross-references, sorted by address or symbol.

### Runtime screens

The runtime screen tool is integrated in PL7 Pro software (creation and use of screens). It is intended in particular, for debugging when starting up installations and for diagnostics on faults or malfunctions.

It comprises data (explanatory texts, dynamic values, synoptics, etc.) and enables a simple and fast action (modification and dynamic monitoring of PLC variables).

The editor enables the design of these screens using the following tools:

- Screen: creation of runtime screens, which can be classed according to family.
- Message: creation of messages used.
- Objects: creation of a graphic objects library.

When the station is connected to the PLC, the user can display screens dynamically depending on the state of the process.

Screen sequencing is possible, depending on the attributed priority, via either the keyboard or PLC request.

In online mode, runtime screens enable direct access to the PL7 program from synoptics by simply clicking on the selected object.

It is also possible to activate the animation table functions or cross references once one or more variables have been selected on the screen. Version ≥ V4.0 of PL7 software also enables character string type objects to be displayed.

Synoptics can be displayed on the full screen for ease of viewing.

F6 Contr	Gest_prod_silo_aDone		1	OUT
F6 Contr	Gest_prod_silo_aVal_cou	158000000007		PULSE

### Debugging tools

PL7 Micro/Junior/Pro software offers a complete set of tools for debugging applications. A tool palette provides direct access to the main functions:

- Setting stop points.
- Step by step program execution.
- Independent execution of the master (MAST), fast (FAST) and event-triggered (EVTi) tasks.

### Animation of program elements

Parts of the program are animated directly when the TSX Micro/Premium PLC is in RUN (rung, Structured Text statement or sequence of instructions in Instruction List language) by activating the PL7 animation function.

Animation is used to display the status of program variables, whatever the language used.

The animation can be frozen. Several windows can be displayed and animated simultaneously.

### Animation tables

Tables containing the application variables to be monitored or modified can be created by entering them or automatically initialized from the selected program part. Variables can then be modified, forced to 0 or to 1 for bit objects.

These tables can be stored in the application and therefore retrieved at a later date.

### Debugging the DFBs

- Animation table: all public parameters and variables are displayed and animated in real time. It is possible to modify and force the desired objects.
- As for the rest of the program, it is possible to use the following functions: breakpoint, step-by-step and program diagnostics.

### Grafcet debugging

In online mode, the browser gives a hierarchical view of the chart with CHART module and macro-step nesting. Animation is characterized by the presence or absence of indicator colors.

The Grafcet debug bar:

- Displays the state of the chart.
- Modifies the state of the chart.
- Gives information on the state of the Master task.

### Debugging the application-specific functions

The debug screens for the application-specific functions are accessed from the I/O configuration screen by clicking on the position in which the module has been defined, when the terminal is in online mode.

These screens are used for:

- Displaying and modifying the state of the I/O.
- Forcing the I/O.
- Displaying and modifying the current values.
- ...

### Diagnostics

The debug screens provide access to the general module or channel diagnostics. These screens identify:

Internal module faults.

- External faults from the application.
- E.g.: range overrun fault for an analog module.

With version ≥ V4.0 of PL7 software, the Premium platform system diagnostics are extended. It is possible to monitor system bits and words as well as to display associated time-stamped messages automatically, without the need for additional programming. This monitoring applies to the system elements (processor, memory, tasks, ...), in-rack I/O and remote I/O on the Fipio bus.

## Variable cross-references

For every variable, this function can be used to:

- Search for program modules where this variable is used.
- Obtain the list of statements, rungs or expressions.
- Display and check activation conditions.

A log is used to keep track of this navigation.

Options relating to the variable, can be associated with the search (extract bit, table object, function block elements, network object, etc.).

This function can be initialized from the program or runtime screens.

## Application converters

PL7 Micro/Junior/Pro software includes application converters which make it possible to reuse in full or in part, applications already written in:

- PL7 2, applications for TSX 17, TSX 27 or TSX 47 10/20/25 PLCs.
- PL7 3 (1), applications for TSX/PMX 47...TSX/PMX 107 PLCs.
- ORPHEE (1), applications for April Series 1000 PLCs.

The converters offer the following utilities:

- Translation of language objects into the new PL7 syntax with retrieval of associated symbols and comments.
- Possibility of manually reassigning objects.
- Configuration check: the tool checks whether the configuration resources required by the program to be converted are compatible with the configuration of the destination application.
- Conversion (1) with generation of source files (Ladder, Structured Text or Grafset) in PL7 Junior/Pro format.
- Conversion ensures that instructions which are translated are functionally identical to the original program.
- A translation report gives a summary:
  - result of the conversion with the cause of non-translation where possible,
  - correspondence of variables in PL7 with original variables.

## X-Way communication drivers

The communication drivers (Uni-Telway COM port and USB port, PC side) are available in the PL7 software CD-Rom.

Depending on needs, another drivers can be be installed from **TLX CD DRV20M** CD-Rom (to order separately). See following table.

Type of drivers	Windows XP Windows 2000	Windows NT	Windows 98 Millenium	Windows 95	OS/2	DOS

(1) Function or functionality requiring PL7 Junior/Pro software.

Functions and instructions

Predefined function blocks (1)

- 64/255 Timers: %T<sub>Mi</sub> (0 ≤ i ≤ 254) 10 ms to 9999 ms
- 32/255 Up/Down counters: %C<sub>i</sub> (0 ≤ i ≤ 254) 0 to 9999 (word)
- 64/255 Timers PL7-2: %T<sub>i</sub> (0 ≤ i ≤ 254)
- 8/255 Monostables: %M<sub>Ni</sub> (0 ≤ i ≤ 254) 16 steps
- 4/255 LIFO or FIFO 16 bit registers: %R<sub>i</sub> (0 ≤ i ≤ 254)
- 8/255 Drums: %D<sub>Ri</sub> (0 ≤ i ≤ 254) 16 steps
- The total number of timers %T<sub>Mi</sub> and %T<sub>i</sub> is limited to 64/255

Type of PL7 instructions

- Instructions on word and double word tables.
- Logical instructions on words and double words.
- Arithmetic instructions on words and double words.
- Instructions on floating point words.
- Instructions on bit tables.
- Character string instructions.
- Binary conversion instructions.
- Time management instructions.
- Logarithmic and exponential instructions.
- Trigonometric instructions.
- Instructions on program.

Addressable objects (2)

### References

Multilingual software packages (English, French, German, Spanish and Italian) for PC compatibles (1) equipped with Windows 98, Windows NT 4.0, Windows Millennium, Windows 2000 Professional or Windows XP operating systems.

For one station, these packages comprise:

- A CD-ROM supporting the PL7 multilingual software, the PL7 demonstration applications and the terminal link Uni-Telway driver.
  - A cable reference TSX PCU 1031, PC compatible with TSX Micro/Premium PLC (length 2.5 m). Not supplied with software upgrade or update packages and PL7 software licenses.
  - Two CD-ROMs containing multilingual technical documentation.
  - A CD-ROM containing the TSX Micro/Premium platform operating systems.
- For packages for 3 stations, the above quantities are multiplied by three. For software licenses, TSX PCX 1031 cables must be ordered separately, according to the required number of users.

All documentation reference (software setup manuals) reference TLX DOC PL7 43F should be ordered separately.

(1) Typical recommended configuration: Pentium processor, 266 MHz, 128 Mb of RAM memory, CD-ROM drive for installation of the PL7 program, VGA screen or above.

## PL7 SMC application converter software

### Presentation

The application converter software for SMC PLCs is a PL7 Junior and PL7 Pro software option. It enables parts of, or in certain cases, the entire existing SMC PLC application to be reused with Micro/Premium PLCs. The converter generates instructions in PL7 language which are functionally identical to the original instructions.

If the application has been archived using VPSOFT programming software (version 3.02 minimum) for SMC PLCs, it is possible to translate the program and comments and retrieve the entire database (variable symbols and comments). If this is not the case, the program only can still be converted once it has been transferred with VPSOFT software. Program conversion is possible for SMC 200/500, SMC 23/35 and SMC 50/600 PLC applications.

The SMC converter provides the following functions:

- Selection of the application in the directory where SMC applications are stored.
- Selection of the program to be converted: sequences to be converted.
- Code and data analysis: associations are suggested for SMC variables with PL7 correspondence (bits, words, double words or reals).
- Code and variable conversion in order to generate a PL7 equivalent.
- Report which shows the user the conversion success rate, associations and causes of non-conversion when applicable.
- Target configuration for displaying or entering a configuration required for arranging variables in PL7.

It is possible to convert only the SMC database.

### Software setup

Once installed, the SMC converter is activated from PL7 (File/Convert command). Translated program modules are converted into an importable source format in a new PL7 application or in the current application.

A consistency check is performed with the current application configuration. It is also possible to modify the destination application while the converter is being used.

Functions

Database conversion

The converter is extremely easy to use. All or part of the symbolised database can be retrieved. Its reassignment services operate on individual data or blocks of data addresses.

I/O reassignment:

The converter in particular enables discrete I/O variables from an SMC PLC to be directly reassigned by module to TSX Micro/Premium PLC modules. It is also possible to merge objects from several SMC modules into a single Premium module (when using modules with 64 channels for example).

Program conversion

The SMC sequential program conversion can be carried out on the entire program or on a selected part of the program. The result of the conversion is a PL7 format source file which can be imported into any task written in Ladder language.

Once an analysis phase is completed, the software offers default correspondence and requests additional information when necessary.

A conversion report provides the following information:

- Result of the conversion for each instruction with the cause of non-conversion if applicable.
- List of variable correspondence before and after conversion, including I/O reassignment.

Reference

This software extension conforms to SMC PLC application conversion requirements using PL7 Junior and PL7 Pro setup software. It comprises:

- A set of 3 1/2 disks.
- A multilingual user manual (English, French and Spanish).

## PL7 DIF application comparison software

### Presentation

PL7 DIF application comparison software for Premium platforms is an optional program which complements the PL7 Pro programming software. It is used to compare two PL7 applications generated by PL7 Pro and automatically provide an exhaustive list of all the differences between them.

The PL7 DIF program increases productivity in the main life phases of a control system based on a Premium platform:

- Application development and debugging.
- Starting up installations and processes.
- Operation and maintenance of installations and processes.

PL7 DIF software is an efficient tool for handling PL7 applications for:

- Control system design offices.
- Operation and maintenance managers.
- Installers and systems integrators.

### Software setup

The PL7 DIF software can be used in one of two modes:

- Interactive mode, when the comparison is launched by an operator command (double-click on the **PL7Diff** software icon).
- "Batch" mode, when it is launched by a previously established call command.

These comparison commands locate all the differences between two applications in terms of:

- The hardware configuration.
- The application access protection.
- The software structure with the section validation conditions.
- The application program regardless of the language(s) used.
- The function modules.
- The code for the DFB user function blocks.
- All the variables.

The result of the comparison between the two applications can be:

- Displayed.
- Printed.
- Saved in .txt format in a differences list.

### Comparison

The end of the comparison operation is signalled by the appearance of the application browser with its three tabs.

1

2

3

- 1 Identification tab for accessing the characteristics of the two applications being compared. The differences are marked by the sign #.
- 2 Browser tab for accessing the application multilevel tree structure.
- 3 List tab for accessing:
  - Printing the comparison list,
  - Creating the comparison file.

Setup (continued)  
Display of results

The representation of the application multilevel tree structure, which can be accessed via the browser tab after launching a comparison, is annotated by 4 symbols in which the information associated with application 1 appear in blue and those associated with application 2 appear in red:

-  This branch, found in this level of the tree structure, contains at least one difference
-  This block contains at least one difference
-  This section is only present in application 1
-  This section is only present in application 2
-  The programming language of this section differs between application 1 and application 2

In the example opposite, a difference on the rung causing changeover to manual mode is detected:

- 1 This line [7] displayed in blue belongs to application 1.
- 2 This line [7] displayed in red belongs to application 2.

The source code extracts of both applications can be used to locate the differences precisely.

Printing a comparison list/creating a comparison file

The list tab is the means of accessing the functions for printing a comparison list or creating a comparison file:

-  Access to the list form for printing a comparison list (or creating a comparison file)
-  Used to include the block selected in the tree structure in the comparison list (or the comparison file)
-  Used to exclude the block selected in the tree structure of the comparison list (or the comparison file)
-  Used to create the comparison list (or the comparison file) according to the selections above
-  Starts printing the comparison list (or saving the comparison file)

References

This software extension can be used to compare two PL7 applications generated by PL7 Pro and designed for TSX Micro/Premium platforms. It comprises one CD-Rom (three disks), containing the PL7 DIF software with its documentation (English and French). A software subscription is available for this extension (please consult your Regional Sales Office).

	TSX Micro/ Premium	3 stations	TLX CD3 PL7 DIF 41	—

## Presentation

C language function development software, also called SDKC, is a PL7 Micro, PL7 Junior and PL7 Pro software option. It enables new functions to be developed (internal code written in C language) and extends and completes the standard set of functions offered by PL7 software.

SDKC software also integrates a creation and management service for families of functions, so they can be integrated in the PL7 library.

Finally, it can be used to generate the function which ensures the protection of PL7 applications by reading a signature in the PCMCIA card inserted in the PLC.

## Setup

C language development software is a genuine tool for managing the entire function which has been created:

- A user-friendly creation interface, integrated in PL7, with automatic file organisation.
- Powerful debug and test tools.
- Management of compatibility and software version for the functions created.
- Generation of disks for the subsequent installation of functions on other development stations.

## Management of function families

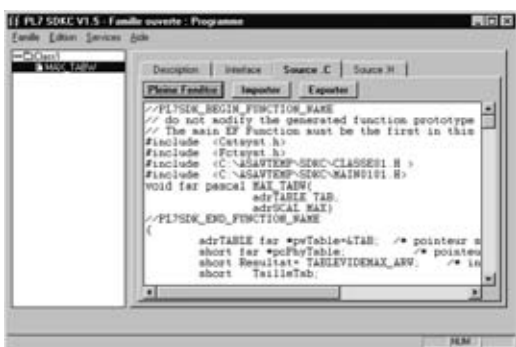

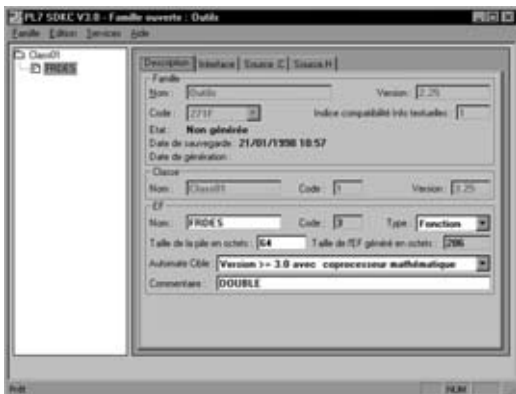

The software enables different function families to be defined. These functions, also known as EF, are classed according to family, allowing the user to create a sequential library of functions written in C language.

These functions, which will eventually form a part of the PL7 library, can be:

- Used in all languages.
- Displayed by the PL7 library tool.
- Classed according to family/function.

The user has the following data at his disposal:

- Date of creation and generation of the function.
- The version number of the function family.

## Editing functions

The various SDKC software editor tabs enable the user to create the function by:

- Declaring the interface (name, type and comment) for each input, output or I/O parameter.
- Writing the source code file in C language.
- Declaring the constants as separate files.

A function written in C language can access numerous internal PLC services such as real-time clock, PLC variables, system words, mathematical functions.

In particular, it is possible to carry out numerical processing in floating point format, if the target PLC allows.

### Setup (continued)

#### Debugging the functions

The function created must be generated under the "debug" format to be tested. Once it has been inserted in an application and loaded to a PLC, the execution of a function can be checked using numerous debug tools.

A specific function debug menu in C language accesses the following services:

- Breakpoint insertion.
- Step by step execution.
- Display of code with breakpoints shown.
- Display of data manipulations.

#### Functions library enhancement

After developing, generating, then debugging the function, the last step consists of generating a function family installation disk.

This enables the function library on the user's programming terminal to be enhanced. Managing the versions allows the level of any functions installed on a station to be known at any time.

These functions can be used in all PL7 languages.

### Reference

This software extension enables standard functions offered by PL7 Micro, PL7 Junior and PL7 Pro version > V4 software to be extended.

It comprises:

- A set of 3 1/2 disks.
- A bilingual user manual (English and French).

This software is supplied with a Microsoft Visual C++ software package registration card.

## PL7 FUZ software for fuzzy logic processing

### Presentation

PL7 FUZ software is a PL7 TSX Micro/Junior/Pro software option enabling fuzzy logic processing in order to optimise the control of processes from Micro and Premium PLCs. This is a software function which can be integrated in any PL7 program. It includes setup and debug tools.

This function is particularly suitable for controlling:

- Systems which are difficult to model or non-linear systems, with wide variation of inputs or an insufficient sensor resolution.
- Systems which are difficult to control and require experience and human intuition.

It enables:

- Boolean logic limits to be exceeded (true or false state).
- The representation of physical measurements by gradual concepts.
- Benefit to be gained from the expertise of operators when controlling a process.

The fuzzy logic function is characterised by:

- 5 physical measurements used as inputs (temperature, pressure, speed...).
- 20 graphic related functions which allow the physical measurement inputs to be represented by predefined associated linguistic terms. A temperature will be represented for example by the terms: low, average, high according to the limits for the various terminals.
- 25 linguistic rules which determine the state to be applied to the outputs (3 conditions and 2 conclusions per rule).
- 4 numerical variables as outputs, results applying to the function input values
- The possibility of debugging its control offline.

Once inserted in a program, the fuzzy function can either operate in continuous mode (function executed on each scan) or on request (a single iteration on each execution). The operating mode enables the function to be used in automatic mode (calculation of the outputs depending on the state of the inputs) or in manual mode (applications with predefined output values).

### Software setup

The fuzzy logic function software is set up in 2 steps:

- Integration of the fuzzy function in the application program, in the same way as any other standard function.
- Setting the fuzzy function parameters using the setup screen.

### Integration in the program

The fuzzy logic function is inserted in the program in all the available languages.

The software checks the various function parameters:

- The 5 input variables.
- The 4 output variables (plus an error bit).
- The internal variables necessary for the function to operate correctly.

The function setup screen is used to access parameters (I/O), membership functions, linguistic rules, as well as debug functions.

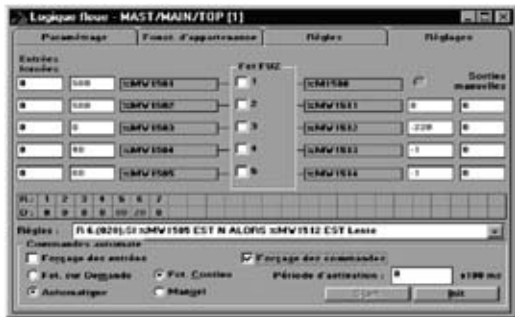

### Membership functions

The membership functions are described intuitively using a suitable layout.

A membership function is characterised by:

- The selection of one of the parameters (I/O).
- The choice of associated linguistic terms from a library of terms predefined or created by the user.
- The type of function to apply for the inputs (trapeze, triangle, etc) as well as its characteristic values and the functions to apply for the outputs (singleton).

### Setup software (continued)

#### Linguistic rules

Linguistic rules (25 maximum) enable experts' know-how to be transcribed using conditions/conclusions such as: If...Then...

- The definition of a rule is made easier by selecting the input parameters (3 per rule).
- By assigning one of the possible linguistic terms to each input.
- By defining the outputs affected by this rule (2 per rule) as well as the associated linguistic terms.

#### Simulation and debug

The fuzzy function is easily debugged using the setup and debug screen, especially simplified by the possibility of simulating the operation offline.

#### Offline simulation

Once the parameter entry screens have been completed, it is possible to perform the fuzzy function operation offline. The debug screen offers the possibility of:

- Forcing values for the various input variables.
- Starting the simulation using the "Start" key.

The results achieved are:

The values which will be applied to the outputs in normal operation.  
The percentages obtained under the various rules.

#### Debug in online mode

In online mode the debug screen enables:

- Display of the state of the I/O.
- Access to the involvement percentages obtained under the various rules.

It can also:

- Force the inputs for testing precise operating points.
- Change to manual mode to apply predetermined values on the outputs.
- Change the operating mode: on request, or continuously by defining a period of activation.

### Reference

This software extension enables standard functions offered by PL7 Micro, PL7 Junior and PL7 Pro software to be extended into the domain of fuzzy logic.

It comprises:

- A set of 3 1/2 disks.
- A multilingual user manual (English, French and German).

#### Software for fuzzy logic processing

### Presentation

The FTX 117 Adjust pocket terminal is used for adjusting Nano/Micro/Premium PLCs. It is used to:

- Read, modify and force valid parameters.
- Save and retrieve PLC object lists.
- Up/down load programs and PLC data (one program and up to 10 data files per protected RAM memory PCMCIA card).

The PLC provides the power supply to the FTX 117 Adjust terminal.

### Description

The front panel of the FTX 117 Adjust terminal comprises:

- 1 A connector for connecting a T FTX CB1 020 cable to the PLC.
- 2 A back-lit screen with 4 lines of 16 alphanumeric characters.
- 3 A keypad with 35 keys.
- 4 A slot for the type 1 PCMCIA memory card.
- 5 Magnets on the rear of the terminal which are used to keep it in a vertical position on a metal support.
- 6 A carrying strap.

### Functions

All functions can be easily accessed at any moment using 7 editors with the following menus:

- **TSX**: has menus for:

- displaying the type of PLC,
- modifying/displaying the PLC operating mode: RUN/STOP/ERR,
- naming the application and the presence of forced bits,
- module diagnostics,
- setting the internal clock of the PLC.

- **DAT**: data editor used to:

- access all variables in real-time display,
- modify or force valid variables,
- access to the modification and display of Grafset steps,
- convert word objects into Hexadecimal, ASCII, decimal or binary code.

- **DT-i**: object list editor used to:

- display or modify a list of 16 variables,
- store and retrieve an object list (63 lists maximum),
- This function requires a PCMCIA card.

- **Frc**: editor to find forced bits is used to:

- find and display forced bits in the PLC.

- **FTX**: terminal editor is used to:

- show the terminal versio,
- select the language (English, French, German, Italian Spanish),
- adjust a beep sound and lighting.

- **Adr**: connection editor used to access PLCs connected to the UNI-Telway bus (master or slave).

- **Trf**: transfer editor requiring a PCMCIA RAM memory card. Used for transfers from PLCs to the PCMCIA card and vice versa, a program and one or more %MWi data files (up to 10 data files) via the FTX 117 terminal.

## Documentation

PLC products generally include:

- A multilingual installation guide in B7 format (128 x 92 mm) for TSX PLC bases and their modules.
- An installation and start-up manual for PL7 software, in A5 format (216 x 181 mm).

A multilingual contextual on-line help is included with PL7 software. The paper version of the hardware and software installation manuals should be ordered separately.

Documentation on CD-Rom (in english)

# Modicon TSX Micro automation platform

## Power consumption of TSX Micro PLC modules

The power supplies incorporated into TSX Micro PLC bases have sufficient nominal power to enable them to activate 60% of discrete inputs and/or outputs simultaneously at state 1. At peak power, these power supplies can activate 100% of discrete inputs and/or outputs simultaneously at state 1 without tripping.

### Note:

- Base supplied in a.c.,  $\sim$  24 V process power supply must be used for the mini extension rack when this supports analogue I/O modules and relay output modules.
- Base supplied in d.c., providing  $\sim$  24 V voltage for the mini extension rack, even if this supports analogue I/O modules and relay output modules.

For configurations near the limit, it is however necessary to establish the power consumption using the table below.

Reference	Format 1/2 : half S : standard	Number	Nominal currents consumed in mA (1)					
			Voltage $\sim$ 5 V		Voltage $\sim$ 24 VR		Voltage $\sim$ 24 V (2)	
			Module	Total	Module	Total	Module	Total
<b>Discrete inputs</b>

<b>Total (to report page 6/5)</b>			Total current (mA)					

(1) The first value corresponds to the module consumption with 60% of inputs and/or outputs at state 1 simultaneously. The second value is for 100% of inputs and/or outputs at state 1.

(2)  $\sim$  24 V sensor voltage, provided by the  $\sim$  100...240 V power supply on basic configurations, is limited to supplying approx. 100 inputs. In excess of this, use a process power supply (see page 2/61).

## Power consumption of TSX Micro PLC modules

- (1) The first value corresponds to the module consumption with 60% of inputs and/or outputs at state 1 simultaneously. The second value is for 100% of inputs and/or outputs at state 1.
- (2) --- 24 V sensor voltage, provided by the ~ 100...240 V power supply on basic configurations, is limited to supplying approx. 100 inputs. In excess of this, use a process power supply (see page 2/61).
- (3) (Consumption on --- 30 V of the power supply for the AS-i bus : 50 mA typical (100 mA max).
- (4) External module to be supplied with --- 24 V: 100 mA typical (200 mA max).

## Standards and certifications

Modicon TSX Micro PLCs have been developed to conform to the principal national and international standards concerning electronic equipment for industrial automation systems.

- Requirements specific to programmable controllers: functional characteristics, immunity, resistance, safety, etc.: IEC 61131-2, CSA 22.2 N° 142, UL 508.
- Merchant navy requirements of the main international bodies: ABS, BV, DNV, GL, LR, RINA, RMRS, etc.
- Compliance with European Directives:
  - Low Voltage: 73/23/EEC amendment 93/68/EEC,
  - Electromagnetic Compatibility: 89/336/EEC amendments 92/31/EEC and 93/68/EEC.
- Electrical qualities and self-extinguishing capacity of insulating materials: UL 746C, UL 94.
- Hazardous areas classification: CSA 22.2 No. 213 Class I, Division 2 II, groups A, B, C and D.

## Characteristics

## Service conditions and recommendations relating to environment

Temperature	Operation	° C	0...+ 60 (to IEC 61131-2, + 5...+ 55) 0...+ 70 with TSX FAN fan modules

	Nominal frequencies	Hz	—	50/60
	Limit frequencies	Hz	—	47/63

## Protective treatment of Modicon TSX Micro PLCs

TSX Micro PLCs meet the requirements of "TC" treatment (*Treatment for all Climates*).

For installations in industrial production workshops or environments corresponding to "TH" treatment (*Treatment for Hot and humid environments*), TSX Micro PLCs must be embedded in envelopes with a minimum IP 54 protection, in compliance with IEC 60664 and NF C 20 040.

TSX Micro PLCs themselves offer **protection to IP 20 level (1)**. They can therefore be installed without an envelope in reserved-access areas which do not exceed **pollution level 2** (control room with no dust-producing machine or activity). The pollution level 2 does not take account of more severe environmental conditions: air pollution by dust, smoke, corrosive or radioactive particles, vapours or salts, attack by fungi, insects, ...

## Environment tests

Name of test	Standards	Levels
<b>Immunity to LF interference (C€) (2)</b>		
Voltage and frequency variation	IEC/EN 61131-2	0.85 Un/0.95 Fn for 30 minutes; 1.15 Un/1.05 Fn for 30 minutes; 0.8 Un/0.9 Fn for 5 seconds; 1.2 Un/1.1 Fn for 5 seconds
Direct voltage variation	IEC/EN 61131-2	0.85 Un...1.2 Un for 30 minutes with 5% ripple (peak values)
Harmonic 3	IEC/EN 61131-2	10 % Un; 0°/5 min...180°/5 min
Short momentary interrupt	IEC/EN 61131-2	10 ms with ~ supply; 1 ms with --- supply
Voltage shut-down/start-up	IEC/EN 61131-2	Un-0-Un; Un for 60 s; 3 cycles separated by 10 s Un-0-Un; Un for 5 s; 3 cycles separated by 1 to 5 s Un-0.9-Udl; Un for 60 s; 3 cycles separated by 1 to 5 s

Where:

Un: nominal voltage

Fn: nominal frequency

Udl: detection level when powered

(C€): tests required by European directives C€ and based on IEC / EN 61131-2 standards.

(5) In the case where a position is not occupied by a module, a **TSX RAZ 01** protection cover must be installed.

(6) Devices must be installed and wired in compliance with the instructions provided in the **TSX DG KBL E** manual "Electromagnetic compatibility of networks and field buses".

Name of test	Standards	Levels
<b>Immunity to HF interference. (C€) (1)</b>		
Damped oscillatory wave	IEC 61000-4-12	~ / --- supply: 1kV in serial mode Discrete I/O ≥ 24V: 1 kV in serial mode
Electrical fast transient bursts	IEC 61000-4-4	~ / --- supply: 2 kV in wire/common mode Discrete I/O > 48V: 2 kV in common mode; other ports: 1 kV in common mode
Surge	IEC 61000-4-5	~ / --- supply: 2 kV in wire mode/1 kV in serial mode; Discrete I/O ~: 2 kV in wire mode/1 kV in serial mode; Discrete I/O ---: 2 kV in wire mode/0.5 kV in serial mode; shielded cable: 1 kV in common mode
Electrostatic discharges	IEC 61000-4-2	6 kV contact, 8 kV air
Radiated electromagnetic field	IEC 61000-4-3	10 V/m; 80 MHz...2 GHz Sinusoidal modulation amplitude 80 %/1 kHz
Conducted interference induced by radiated field	IEC 61000-4-6	10 V/0,15 MHz...80 MHz Sinusoidal modulation amplitude 80%/1 kHz
<b>Electromagnetic emissions (C€) (1) (2)</b>		
Interference voltage	IEC 61000-6-4	Class A 150 kHz...500 kHz quasi-peak 79 dB (μV); average 66 dB (μV) 500 kHz...30 MHz quasi-peak 73 dB (μV); average 60 dB (μV)
Interference field	IEC 61000-6-4	Class A, 10 m measurement 30 MHz...230 MHz quasi-peak 40 dB (μV); 230 MHz...1 GHz quasi-peak 47 dB (μV)
<b>Immunity to climatic variations</b>		
Dry heat	IEC 60068-2-2 Bd	60 ° C for 16 hours (D.O); 40 ° C for 16 hours (D.C)
Cold	IEC 60068-2-1 Ad	0 ° C for 16 hours
Continuous humid heat	IEC 60068-2-3 Ca	60 ° C with 93 % relative humidity/96 hours (D.O); 40 ° C with 93...95 % relative humidity/96 hours (D.C);
Cyclical humid heat	IEC 60068-2-3 Db	[55 ° C (D.O)/40 ° C (D.O)] - 25 ° C with 93...95 % relative humidity; 2 cycles: 12 hours/12 hours
Cyclical temperature variations	IEC 60068-2-14 Nb	0 ° C...60 ° C/5 cycles: 6 hours/6 hours (D.O) 0 ° C...40 ° C/5 cycles: 6 hours/6 hours (D.C)
Temperature Rise	IEC 61131-2/UL 508 CSA 22-2 No.142	Ambient temperature: 60 ° C
<b>Withstand to climatic variations</b>		
Dry heat (power off)	IEC 60068-2-2 Bb	70 ° C for 96 hours
Cold (power off)	IEC 60068-2-1 Ab	-25 ° C for 96 hours
Humid heat (power off)	IEC 60068-2-30 dB	60 ° C-25 ° C with 93...95 % relative humidity; 2 cycles: 12 hours/12 hours
Heat shocks when not operational	IEC 60068-2-14 Na	- 25 ° C...70 ° C; 2 cycles: 3 hours/3 hours
<b>Immunity to mechanical constraints</b>		
Sinusoidal vibrations	IEC 60068-2-6 Fc	3 Hz...100 Hz/1 mm amplitude/0.7 g; endurance: fr/90 min/axis (application coefficient < 10)
	IEC 60068-2-6 Fc	10...150 Hz/150 μm amplitude/2 g; endurance: 10 cycles of 1 octave/min
Shocks	IEC 60068-2-27 Ea	15 g-11 ms; 3 shocks/direction/axis
<b>Withstand to mechanical constraints</b>		
Flat freefall	IEC 60068-2-32 Ed	10 cm/2 falls
Controlled position freefall	IEC 60068-2-31 Ec	30 ° or 10 cm/2 falls
Random freefall, equipment in packaging	IEC 60068-2-32 method 1	1 m/5 falls
<b>Equipment and personnel safety (1)</b>		
Dielectric strength and insulation resistance (C€)	UL 508/CSA 22-2 No.14 IEC 60950	--- 24 V supply: no isolation; ~ 100/220V supply: 2,000 V rms Discrete I/O ≥ 48 V: 500 V rms; Discrete I/O > 48 V: 2,000 V rms; > 10 MΩ
Continuity of earth(C€)	UL 508 CSA 22-2 No.142	< 0,1 Ω/30 A/2 min
Leakage current (C€)	CSA 22-2 No.142/IEC 60950	< 3.5 mA fixed device
Protection offered by enclosures (C€)	CSA 22-2 No.142 IEC 60950	IP 20
Withstand to impacts	CSA 22-2 No.142/IEC 60950	500 g sphere: fall from 1.3 m

D.O: Device Open (device to be embedded in an envelope;

D.C: Device Closed (device can be installed without envelope), see (1) page 6/6

(C€): tests required by European directives C€, and based on IEC / EN 61131-2 standards.

(1) Devices must be installed and wired in compliance with the instructions provided in the **TSX DG KBL E** manual "Electromagnetic compatibility of networks and field buses".(2) These tests are performed without a cabinet, with devices **fixed on a metal grid** and wired as per the recommendations in the industrial **TSX DG KBL E** manual "Electromagnetic compatibility of networks and field buses".

# Modicon TSX Micro automation platform

## Automation products certifications

In some countries, certification of certain electrical components is enforced by law. A standard conformity certificate is then issued by the official organization. Each certified product must carry approval symbols when enforced. Use on board merchant navy vessels generally requires prior approval (= certification) of an electrical device by certain marine classification authorities.

Key	Certification body	Country
CSA	Canadian Standards Association	Canada
C-Tick	Australian Communication Authority	Australia
GOST	Institut de recherche Scientifique Gost Standardt	C.I.S., Russia
UL	Underwriters Laboratories	USA
Key	Classification authority	Country
ABS	American Bureau of Shipping	USA
BV	Bureau Veritas	France
DNV	Det Norske Veritas	Norway
GL	Germanischer Lloyd	Germany
LR	Lloyd's Register	United-Kingdom
RINA	Registro Italiano Navale	Italy
RMRS	Register of Shipping	C.I.S.

The table below shows the situation as of the 01.05.2002 for certifications obtained or pending from organizations for base PLCs. An overview of certificates for Telemecanique products is available on our Internet web site :

[www.telemecanique.com](http://www.telemecanique.com)

### Community regulations

#### European directives

The opening of European markets implies a harmonization of regulations in the various European Union member states.

European Directives are documents used to remove obstacles to the free movement of goods and their application is compulsory in all states of the European Union. Member states are obliged to transcribe each Directive into their national legislation and, at the same time, to withdraw any conflicting regulations.

The Directives, particularly those of a technical nature with which we are concerned, only set objectives, called "general requirements".

The manufacturer must take all necessary measures to ensure that his products conform to the requirements of each Directive relating to his equipment.

As a general rule, the manufacturer affirms that his product conforms to the necessary requirements of the Directive(s) by applying the **CE** label to his product.

**CE** marking is applied to Telemecanique products where relevant.

#### The significance of CE marking

■ **CE** marking on a product means that the manufacturer certifies that his product conforms to the relevant European Directives ; it is necessary in order that a product which is subject to a Directive(s) can be marketed and freely moved within the European Union.

■ **CE** marking is intended solely for the national authorities responsible for market regulation.

For electrical equipment, only conformity of the product to standards indicates that it is suitable for use, and only a guarantee by a recognised manufacturer can ensure a high level of quality.

One or more Directives, as appropriate, may apply to our products, in particular :

■ The Low Voltage Directive 72/23/EEC amended by Directive 93/68/EEC : **CE** marking under the terms of this Directive is compulsory as of 1 January 1997.

■ The Electromagnetic Compatibility Directive 89/336/EEC, amended by Directives 92/31/EEC and 93/68/EEC : **CE** marking on the products covered by this Directive has been compulsory since 1 January 1996.
