Rossi for You

Innovation

Rossi offers a wide range of **solutions for an evolving industry**, flexible and innovative gearboxes and gearmotors for customer tailored solutions to maximize performance and minimize the total cost of ownership.

High quality, 3 years warranty

Our drive is to innovate and boost operations by manufacturing performing, precise, reliable and high-quality products all over the world. We are always one step forward in offering and developing solutions that can satisfy an unlimited number of application needs, even in the most demanding conditions.

Reliability

We are a reliable company with the right flexibility and know-how to respond to worldwide market requests, in all application fields, without leaving aside our commitment for the environment and value on human safety, to protect everyone's future.

Tools and processes

We continue to invest in new tools and processes, so our highly skilled specialist team in different fields are supporting you to find the best solution suitable for your demands, always by your side on every step of the project.

After-sale service

Highly trained mechanics and support teams can ensure a fast and efficient after-sale service providing support worldwide.

Digital support

Alongside our 24/7 **Rossi for You** support portal you have a suite of digital support tools enabling real time access to your order tracking, invoices, spare part tables download and contact to our service.

70
YEARS

Experience

Shaped by more than 70 years of history Rossi meets your unique needs whether you need a standard design or a customized solution.

Global presence local service

Local support

Sales, customer service,
technical support, spare parts

15 branches*

Worldwide distribution network*

A widespread sales network of subsidiaries and dealers in nearly all industrialized countries. By your side from the design to after-sale phase, Rossi is a flexible and dependable partner throughout the world.

Rossi for You, our customer web portal, provides a 24/7 global coordination of the ordering, supply and service processes.

Additional indexes and other signs

Ind.	Definition
max	maximum
min	minimum
N	nominal
1	relating to high speed shaft (input)
2	relating to low speed shaft (output)
+	from ... to
≈	approximately equal to
≥	greater than or equal to
≤	less than or equal to

1) SI are the initials of the International Unit System, defined and approved by the General Conference on Weights and Measures as the only system of units of measure.
Ref. CNR UNI 10 003-84 (DIN 1 301-93 NF X 02.004, BS 5 555-93, ISO 1 000-92).
UNI: Ente Nazionale Italiano di Unificazione.
DIN: Deutscher Normenausschuss (DNA).
NF: Association Française de Normalisation (AFNOR).
BS: British Standards Institution (BSI).
ISO: International Organization for Standardization.

2) Newton [N] is the force imparting an acceleration of 1 m/s² to a mass of 1 kg.

3) Kilogramme [kg] is the mass of the prototype kept at Sèvres (i.e. 1 dm³ of distilled water at 4 °C).

4) Joule [J] is the work done when the point of application of a force of 1 N is displaced through a distance of 1 m.

Universal mounting (patented; lower feet, upper feet, B5 flange with low speed shaft end shifted forward) excluding sizes 32 ... 41.

Closer intermediate size steps (for size pairs, standard and strengthened, only one housing and many components in common, changing only the ones allowing higher performances of greater size; improved modular construction) **offering sizes closer to every application need and maintaining nearly the same component number for maximum economy of solution; same mounting dimensions for the size pairs**

Rigid and precise single-piece cast iron housing (excluding sizes 32 ... 41)

Generously proportioned bearings of low speed shaft (bearings and shaft) **in order to withstand high loads** on shaft end

Possibility of mounting large size motors

Manufacturing and product management flexibility

High manufacturing quality standard

Minimum maintenance requirements

Standard motor to IEC

High, reliable and tested performances

Pinion of final reduction with three bearings (excluding sizes 32 ... 41) **in order to ensure best meshing conditions** (no overhang wheel; maximum rigidity and overloading capacity, maximum reduction of noise level)

This range of gear reducers and gearmotors combines and exalts the traditional qualities of coaxial gear reducers – **compactness, economy** –, with the ones deriving from modern design, manufacturing and operating criteria – **strength and suitability also for heaviest applications, universality and ease of application, wide range of sizes, service** – the advantages typically associated with high quality gear reducers produced in large series.

Foot mounting

«Standard» shaft height (H)

«Low» shaft height (H₀), minimum overall dimensions

Adaptor for interchangeability

Flange mounting

Standard flange (through holes) and low speed shaft end shifted forward for minimum overhang

Oversized flange (through holes) and low speed shaft end having shoulder coinciding with flange plane

a - Gear reducer

Structural features

Main specifications are:

- **universal mounting (patented)** with lower and upper feet and B5 flange **integral** with housing (excluding sizes 32 ... 41 whose mounting is either with feet or with flange always integral with housing);
- **low speed shaft end** shifted forward (excluding size 40) compared to flange plane, for **smaller overhang** having same position of external radial load;
- modern conception according to Rossi **new modular system** (improved modular construction both for component parts and assembled product); to withstand **high loads on high and low speed shaft ends**;

1) H, H₀ shaft height
 D Ø low speed shaft end
 M_{N2} nominal torque [daN m]
 F_{r2} radial load [daN]

- maximum compactness and reduced overall dimensions – and equal for 2l and 3l – especially in longitudinal direction; coaxial low and high speed shafts excluding sizes 140 ... 180 for which they are slightly misaligned (see ch. 3.2 and 3.8);
- **single-piece** cast iron **housing** 200 UNI ISO 185 (excluding sizes 32 ... 41) with **stiffening ribs** and high lubricant capacity;
- gear reducer overall sized so as to accept particularly powerful motors, to permit the transmission of **high** nominal and maximum **torques** and support **high loads on low and high speed shaft ends**;
- cylindrical roller or ball bearings on intermediate shafts duly sized for every condition;
- bearings of **low speed shaft** generously proportioned in order to withstand high loads on low speed shaft end (which is also proportioned for the same purpose);

Cuscinetto Bearing	Grandezza - Size

- pinion of final reduction with **three bearings** (excluding sizes 32 ... 41) in order to ensure best meshing conditions (no overhang wheel, maximum rigidity and **overloading capacity**, maximum **reduction of noise level**);
- gear reducers: input face having machined flange and holes (excluding sizes 32 and 40);
- gearmotors: **standard motor to IEC** with pinion directly mounted onto shaft end;
- shaft end with parallel key and tapped butt-end hole;
- standard dimensions and compliance with standards;
- grease or oil-bath lubrication; with synthetic grease for sizes 32 ... 41 or synthetic oil sizes 50 ... 81 all supplied **filled with lubricant** for lubrication **«for life»** and with a plug (sizes 32 ... 64) or two plugs (sizes 80 and 81); with synthetic or mineral oil (ch. 4) with filler plug with **valve**, drain and level plug (sizes 100 ... 180); sealed;
- **paint external** coating in epoxy powder paint (sizes 32 ... 41) or water based dual compound acrylic-polyurethane resin basis enamel (sizes 50 ... 180) resistant to atmospheric and aggressive agents (corrosivity category C3 ISO 12944-2); suitable for further coats only with dual-compound products after degreasing and sanding; color blue RAL 5010 DIN 1843, other colors and/or painting cycles on request); **internal** protection with epoxy powder paint (sizes 32 ... 41) suitable to resist synthetic oils or with synthetic paint (sizes 50 ... 180) suitable to resist polyalphaolefines based synthetic or mineral oils.
- possibility of obtaining combined gear reducer and gearmotor units providing high transmission ratios;
- non-standard designs: see ch. 5.

Train of gears:

- 2, 3 cylindrical gear pairs (5, 6 in combined units);
- 7 sizes with final reduction centre distance to R 10 series (32 ... 125, with 6 size pairs: standard and strengthened); 3 sizes with final reduction centre distance to R 20 series (140 ... 180) for a total of **16 sizes**;
- nominal transmission ratios to R 10 series (6,3 ... 6 300) for gear reducers;
- output speeds close to standard number R 20 series (0,45 ... 710 min⁻¹) for gearmotors;
- casehardened and hardened gear pairs in 16 CrNi4 or 20 MnCr5 steel depending on size and 18 NiCrMo5 steel, according to UNI 7846-78;
- helical toothed gear pairs with **ground** profile;
- gears load capacity calculated for tooth breakage and pitting.

Specific standards:

- nominal transmission ratios and main dimensions according to UNI 2016 standard numbers (DIN 323-74, NF X 01.001, BS 2045-65, ISO 3-73);
- tooth profiles to UNI 6587-69 (DIN 867-86, NF E 23.011, BS 436.2-70, ISO 53-74);
- shaft heights to UNI 2946-68 (DIN 747-76, NF E 01.051, BS 5186-75, ISO 496-73);
- fixing flanges B14 and B5 taken from UNEL 13501-69 (DIN 42948-65, IEC 72.2);
- medium series fixing holes to UNI 1728-83 (DIN 69-71, NF E 27.040, BS 4186-67, ISO/R 273);
- cylindrical shaft ends (long or short) to UNI ISO 775-88 (DIN 748, NF E 22.05.051, BS 4506-70, ISO/R775) with tapped butt-end hole to UNI 9321 (DIN 332 Bl. 2-70, NF E 22.056) excluding d-D diameter ratio;
- parallel keys to UNI 6604-69 (DIN 6885 Bl. 1-68, NF E 27.656 and 22.175, BS 4235.1-72, ISO/R/773-69) except for specific cases of motor-to-gear reducer coupling where key height is reduced;
- mounting positions taken from CEI 2-14 (DIN EN 60034-7, IEC 34.7);
- load capacity verified according to UNI 8862, DIN 3990, AFNOR E 23-015, ISO 6336 for running time \geq **12 500 h**.

Sound levels L_{WA} and \bar{L}_{pA} [dB(A)]

Standard production sound power level L_{WA} [dB(A)]¹⁾ and mean sound pressure level \bar{L}_{pA} [dB(A)]²⁾ for gearmotors assuming nominal load, and input speed $n_1 = 1\ 400^{3)}\ \text{min}^{-1}$. Tolerance +3 dB(A).

If required, gear reducers can be supplied with reduced sound levels (normally 3 dB(A) below tabulated values); consult us.

Values in table are valid also for gear reducers.

In case of gearmotor with 4 poles 60 Hz motor (motor supplied by Rossi) add 1 dB(A) to the values in table.

Size and train of gears	Gearmotors with 4 poles motor

1) To ISO/CD 8579.

2) Mean value of measurement at 1 m from external profile of gear reducer standing in free field on a reflecting surface.

3) For n_1 , $710 \div 1\ 800\ \text{min}^{-1}$, modify tabulated values thus: $n_1 = 710\ \text{min}^{-1}$, -3 dB(A); $n_1 = 900\ \text{min}^{-1}$, -2 dB(A); $n_1 = 1\ 120\ \text{min}^{-1}$, -1 dB(A); $n_1 = 1\ 800\ \text{min}^{-1}$, +2 dB(A).

b - Electric motor

Gearmotor dimensions and masses of present catalog (see ch. 3.6 and 3.8) refer to HB and HBZ motors (cat. TX).

Main structural features (HB motor and HBZ brake motor)

- motor **standardized to IEC**;
- asynchronous three-phase, totally-enclosed, externally ventilated, with cage rotor;
- single polarity, frequency 50 Hz, voltage Δ 230 V Y 400 V (size ≤ 132), Δ 400 V (size ≥ 160);
- **IP 55** protection, **insulation** class **F**, temperature rise class **B**;
- rated power delivered on continuous duty S1 (excluding some cases of motor sizes with power not according to standard; see specific documentation) and referred to nominal voltage and frequency; maximum ambient temperature 40 °C and altitude 1 000 m;
- capacity to withstand one or more overloads up to 1,6 times the nominal load for a maximum total period of 2 min per single hour;
- starting torque with direct on-line start at least 1,6 times the nominal one (it is usually higher);
- mounting position B5 and derivatives as shown in the following table;
- **suitable for inverter duty** (generous electromagnetic sizing, low-loss electrical stamping, phase separators, etc.)
- designs available for every application need: flywheel, independent cooling fan, independent cooling fan and encoder, etc.

Constructive features of HBZ brake motor

- particularly strong construction to withstand braking stresses; **maximum reduction of noise level**;
- spring-loaded d.c. electromagnetic brake; feeding from the terminal box; brake can also be independently fed directly from the line;
- braking torque **proportioned** to motor torque (usually $M_f \approx 2 M_N$) and adjustable by adding or removing spring pairs;
- possibility of high frequency of starting;
- quick and rapid stop;
- hand lever for manual release with automatic return (on request for size $\leq 160S$); removable lever rod.

For other specifications and details see **specific documentation of cat. TX**

ATTENTION: Electric motor flange of gearmotors MR 3l 50, 51 with motor size 63 must have the two top holes slotted outwards as shown in the drawing.

Short time duty (S2) and intermittent periodic duty (S3); duty cycles S4 ... S10

In case of a duty-requirement type S2 ... S10 the motor power can be increased as per the following table; starting torque keeps unchanged.

Short time duty (S2). — Running at constant load for a given period of time less than that necessary to reach normal running temperature, followed by a rest period long enough for motor's return to ambient temperature.

Intermittent periodic duty (S3). — Succession of identical work cycles consisting of a period of running at constant load and a rest period. Current peaks on starting are not to be of an order that will influence motor heat to any significant extent.

$$\text{Cyclic duration factor} = \frac{N}{N+R} \cdot 100\%$$

where: N being running time at constant load,
 R the rest period and $N + R = 10$ min (if longer consult us)

Servizio - Duty		Grandezza motore ¹⁾ - Motor size ¹⁾		
		63 ... 90	100 ... 132	160 ... 280

		15%	1,32	
S4 ... S10		interpellarci - consult us		

1) For motor sizes 90LC 4, 112MC 4, 132MC 4, consult us.

Frequency 60 Hz

Normal motors up to size 132 wound for 50 Hz can be fed at 60 Hz; in this case speed increases by 20%. If input-voltage corresponds to winding voltage, power keeps unchanged, providing that higher temperature rise values are acceptable, starting is not on full load and that the power requirement is not unduly demanding, whilst starting and maximum torques decrease by 17%. If input-voltage is 20% higher than winding voltage, power increases by 20% whilst starting and maximum torques keep unchanged.

For **brake** motors see **specific literature**.

From size 160 upwards motors — both standard and brake ones — should be wound for 60 Hz exploiting the 20% power increase as a matter of course.

Power available with high ambient temperature or high altitude

When motor has to run at an ambient temperature higher than 40 °C or at altitude above sea level higher than 1 000 m, it has to be derated according to the following tables:

Temperatura ambiente [°C] Ambient temperature [°C]	30	40	45	50	55	60	
P/P_N [%]	106	100	96,5	93	90	86,5	
Altitudine s.l.m. [m] Altitude l.a.s. [m]	1 000	1 500	2 000	2 500	3 000	3 500	4 000
P/P_N [%]	100	96	92	88	84	80	76

Specific standards:

- nominal powers and dimensions to CENELEC HD 231 (IEC 72-1, DIN 42677, NF C51-120, BS 5000-10 and BS 4999-141) for mounting positions IM B5, IM B14 and derivatives;
- nominal performances and running specifications to CENELEC EN 60034-1 (IEC 34-1, CEI EN 60034-1, DIN VDE 0530-1, NF C51-111, BS 4999-101);
- protection to CENELEC EN 60034-5 (IEC 34-5, CEI 2-16, DIN EN 60034-5, NF C51-115, BS 4999-105);
- mounting positions to CENELEC EN 60034-7 (IEC 34-7, CEI EN 60034-7, DIN IEC 34-7, NF C51-117, BS EN 60034-7);
- sound levels to CENELEC 60034-9 (IEC 34.9, DIN 57530 pt. 9);
- balancing and vibration velocity (vibration under standard rating N) to CENELEC HD 53.14 S1 (IEC 34-14, ISO 2373 CEI 2-23, BS 4999-142); motors are balanced with half key inserted into shaft extension;
- cooling to CENELEC EN 60034-6 (CEI 2-7, IEC 34-6): standard type IC 411; type IC 416 for non-standard design with axial independent cooling fan.

Asynchronous three-phase motors, brake motors

HE - HB
Asynchronous three-phase motor

HEZ - HBZ
Asynchronous three-phase **brake motor**
with **d.c. brake**

HBF
Asynchronous three-phase **brake motor**
with **a.c. brake**

HBV
Asynchronous three-phase **brake motor**
with **d.c. safety brake**

Advanced design motors sharing the **same stator windings**, the same **rotors**, the same **housings**, the same **flanges**, the same performance, and the majority of technical solutions with its twin brake motor series (**HEZ, HBZ, HBF, and HBV**).

The generous electromagnetic sizing allow to achieve **high efficiency values** complying **with different energy saving regulations**:

- Efficiency class **IE3 (ErP)** for HB and HE;
- Efficiency class **IE3 (ErP)** for HEZ and HBZ

The electric design (terminal block, name plate, etc.) has been studied to comply, as standard, also with **NEMA MG1-12** for the maximum application flexibility and facility.

The strength and the precision of mechanical construction, the generous bearings and the wide range of non-standard designs available on catalog make this motor particularly suitable for coupling with gearmotors.

Thanks to its outstanding **low noise**, **progressivity** and **dynamic** characteristics, it is specifically suitable for **coupling with gearmotor minimizing the dynamic overloads** deriving from **starting and braking phases** (especially in case of motion reversals) and maintaining a **very good braking torque value**.

The excellent **operation progressivity** - when starting and braking - is assured by the brake anchor which is less quick in the impact (compared to a.c. HBF) and by the slight quickness of d.c. brakes.

Offering a comprehensive **range of accessories and non-standard designs** in order to satisfy all possible gearmotor application fields.

The **high reactivity** typical of **a.c. brake** and the **high braking capacity** make this brake motor **particularly suitable for heavy duties** requiring **quick brakings** and a **high number of operations** (e.g.: lifts with high frequency of starting, usually for size > 132, and/or for jog operations).

Vice versa, its very **high dynamic characteristics** (rapidity and frequency of starting) **are not advisable for the use in gearmotor coupling**, especially when these features are not strictly necessary for the application (avoiding useless overloads on the whole transmission).

Comprehensive **range of accessories and non-standard designs** in order to satisfy all application needs of gearmotors (in particular for HBF: IP 56, IP 65, encoder, independent cooling fan, independent cooling fan and encoder, double extension shaft, etc.).

Featuring **maximum economy**, **very reduced overall dimensions and moderate braking torque**, it is suitable for the coupling with gearmotor and can be applied as brake for **safety or parking stops** (e.g. cutting machines) and for operations at deceleration ramp end **during the running with inverter**.

The standard cast iron fan supplies a flywheel effect increasing the very good progressivity of starting and braking (typical of d.c. brake) being particularly **suitable for «light»¹⁾ traverse movements**.

1) Mechanism group M4 (max 180 starts/h) and on-load running L1 (light) or L2 (moderate) to ISO 4301/1, F.E.M./II 1997.

MR **3I** **50** **U** **C** **2** **A** - **19 × 200** - **22,7** **V5** **HB3 80B4 230.400-50 B5** **TB3**

MACHINE

R gear reducer
MR gearmotor

Gear reducer mounting position

Gear reducer and gearmotor mounting positions are described in ch. 3.6, 3.8 (the mounting position designation refers to foot mounting only, even if gear reducers are for universal mounting, sizes 32 ... 41 excluded).

When having no particular needs, **prefer B3** (B3 or B5 for sizes 32 ... 41) **mounting position** for its technical and economic cost effectiveness (maximum simplification of lubrication system, lower oil splash, lower gear reducer heating, stock availability).

Input speed

Complete the designation stating the input speed n_1 , if $> 1400 \text{ min}^{-1}$:

Example:

R 2l 50 UC2A / 29,3 $n_1 = 2000 \text{ min}^{-1}$

Motor

When the gearmotor is supplied **equipped with a standard Rossi motor**, fill in the designation stating the motor designation (ref. cat. TX).

Example:

MR 3l 140 UC2A - 48 x 350 - 20,4

HB3 180M 4 400-50 B5

When **brake motor** is required, insert the letters **HBZ** (ref. cat. TX).

Example:

MR 3l 140 UC2A - 48 x 350 - 20,4

HB3Z 180M 4 400-50 B5

When the gearmotor is equipped **without motor**, omit the designation and add «without motor».

Esempio:

MR 3l 140 UC2A - 48x350 - 20,4

without motor

When motor is supplied by the **Buyer**¹⁾, complete the designation by stating the description of «motor supplied by us».

1) The motor, supplied by the Buyer must be to IEC with mating surfaces machined under accuracy rating IEC 60072-1 and is to be sent carriage and expenses paid to our factory for fitting to the gear reducer.

Example:

MR 3l 140 UC2A - 48x350 - 20,4

motore supplied by us

Motor terminal box position

Complete the designation stating the motor terminal box position if differing from the standard one (TB0; scheme below); the cable input is Buyer's responsibility.

Example:

MR 3l 140 UC2A - 48x350 / 20,4

HB3 180M 4 400-50 B5 **TB3**

View from drive end (D)

View from non-drive end (N)

Accessories and non-standard designs

In the event of a gear reducer or gearmotor being required in a design different from those stated above, specify it in detail (ch. 5).

Nominal thermal power P_{tN} , written in red in the following tables, is that which can be applied at the gear reducer input without exceeding 95 °C¹⁾ approximately oil temperature when operating in following running conditions:

- input speed $n_1 = 1\ 400\ \text{min}^{-1}$;
- mounting position B3;
- continuous duty S1;
- maximum ambient temperature 40 °C;
- maximum altitude 1 000 m above sea level;
- air speed $\geq 1,25\ \text{m/s}$ (typical value in presence of a gearmotor with self cooled motor).

For the cases marked at ch. 7 and 9 it should be always verified that the applied power P_i is less than or equal to gear reducer nominal thermal power P_{tN} multiplied by the corrective coefficients f_{t1} , f_{t2} , f_{t4} , f_{t5} (stated in the following tables) considering the several operational conditions:

$$P_i \leq P_{tN} \cdot f_{t1} \cdot f_{t2} \cdot f_{t4} \cdot f_{t5}$$

When this condition is not satisfied consider the use of special lubricant or a cooling unit with heat exchanger: consult us.

Thermal power needs not be taken into account when maximum duration of continuous running time is 1 ÷ 3 h (from small to large gear reducer sizes) followed by rest periods long enough to restore the gear reducer to near ambient temperature (likewise 1 ÷ 3 h). In case of maximum ambient temperature above 50 °C or below 0 °C consult us.

Nominal thermal power P_{tN} [kW]

Train of gears	P_{tN} [kW]					
	80, 81	100, 101	125, 126	140	160	180
2I	15	22,4	33,5	35,5	53	56
3I	11,2	17	25	26,5	40	42,5

Thermal factor f_{t1} according to input speed n_1

Train of gears	f_{t1}				
	Input speed n_1 , [min ⁻¹] \geq				
	710	900	1 120	1 400	1 800
2I	1,18	1,12	1,06	1	0,85
3I	1,06	1,06	1,03	1	0,95

Thermal factor f_{t2} according to ambient temperature and duty

Maximum ambient temperature [°C]	f_{t2}				
	Continuous duty S1	Intermittent duty S3 ... S6			
		Cyclic duration factor for 60 min running ²⁾			
		60	40	25	15
50	0,8	0,95	1,06	1,18	1,32
40	1	1,18	1,32	1,5	1,7
30	1,18	1,4	1,6	1,8	2
20	1,32	1,6	1,8	2	2,24
10	1,5	1,8	2	2,24	2,5

Thermal factor f_{t4} according to altitude

Altitude a.s.l [m]	f_{t4}
$\leq 1\ 000$	1
1 000 ÷ 2 000	0,95
2 000 ÷ 3 000	0,9
3 000 ÷ 4 000	0,85
$\geq 4\ 000$	0,8

Thermal factor f_{t5} according to air speed on the housing

Air speed m/s	Working environment	f_{t5}
< 0,63	very small or no air movement or gear reducer shielded	consult us
0,63	small and with limited air movement	0,71
1	large and without ventilation	0,9
1,25	large and with slight ventilation (e.g. gearmotor with self-cooled motor)	1
2,5	outdoor ventilated	1,18
4	strong air movement	1,32

1) Corresponding to an average temperature of the external housing surface of approximately 85 °C; locally housing temperature can achieve the oil temperature.
 2) (Duration of running on load / 60) · 100 [%].

Service factor f_s takes into account the different running conditions (nature of load, running time, frequency of starting, other considerations) which must be referred to when performing calculations of gear reducer selection and verification.

The powers and torques shown in the catalog are nominal (i.e. valid for $f_s = 1$) for gear reducers, corresponding to the f_s indicated for gearmotors.

Service factor based: on the **nature of load** and **running time** (this value is to be multiplied by the values shown in the tables alongside).

...: on **frequency of starting** referred to the nature of load.

Natura del carico della macchina azionata Nature of load of the driven machine		Durata di funzionamento [h] Running time [h]					Rif. carico Load ref.								
Rif. Ref.	Descrizione Description	3 150 ≤ 2 h/d	6 300 2÷4 h/d	12 500 4÷8 h/d	25 000 8÷16 h/d	50 000 16÷24 h/d	Frequenza di avviamento z [avv./h] Frequency of starting z [starts/h]								
							2	4	8	16	32	63	125	250	
a	Uniforme Uniform	0,8	0,9	1	1,18	1,32	a	1	1,06	1,12	1,18	1,25	1,32	1,4	1,5
b	Sovraccarichi moderati (entità 1,6 volte il carico normale) Moderate overloads (1,6 × normal)	1	1,12	1,25	1,5	1,7	b	1	1	1,06	1,12	1,18	1,25	1,32	1,4
c	Sovraccarichi forti (entità 2,5 volte il carico normale) Heavy overloads (2,5 × normal)	1,32	1,5	1,7	2	2,24	c	1	1	1	1,06	1,12	1,18	1,25	1,32

Details of service factor, and considerations.

Given f_s values are valid for:

- electric motor with cage rotor, direct on-line starting up to 9,2 kW, star-delta starting for higher power ratings; for direct on-line starting above 9,2 kW or for brake motors, select f_s according to a frequency of starting double the actual frequency; for internal combustion engines multiply f_s by 1,25 (multicylinder) or 1,5 (single-cylinder);
- maximum time on overload 15 s; on starting 3 s; if over and/or subject to heavy shock effect, consult us;
- a whole number of overload cycles (or start) **imprecisely** completed in 1, 2, 3 or 4 revolutions of low speed shaft; if **precisely** a continuous overloads should be assumed;
- **standard** level of reliability; if a **higher** degree of reliability is required (particularly difficult maintenance conditions, key importance of gear reducer to production, personnel safety, etc.) multiply f_s by **1,25 ÷ 1,4**.

Motors having a starting torque not exceeding nominal values (star-delta starting, particular types of motor operating on direct current, and single-phase motors), and particular types of coupling between gear reducer and motor, and gear reducer and driven machine (flexible, centrifugal, fluid and safety couplings, clutches and belt drives) affect service factor favourably, allowing its reduction in certain heavy-duty applications; consult us if need be.

a - Gear reducer

Determining the gear reducer size

- Make available all necessary data: required output power P_2 of gear reducer, speeds n_2 and n_1 , running conditions (nature of load, running time, frequency of starting z , other considerations) with reference to ch. 5.
- Determine service factor fs on the basis of running conditions (ch. 5).
- Select the gear reducer size (also, the train of gears and transmission ratio i at the same time) on the basis of n_2 , n_1 and of a power P_{N2} greater than or equal to $P_2 \cdot fs$ (ch. 7).
- Calculate power P_1 , required at input side of gear reducer using — the formula $\frac{P_2}{\eta}$, where $\eta = 0,96 \div 0,94$ is the efficiency of the gear reducer (ch. 3.13).

When for reasons of motor standardization, power P_1 applied at input side of gear reducer turns out to be higher than the power required (considering motor/gear reducer efficiency), it must be certain that this excess power applied will never be required, and frequency of starting z is so low as not to affect service factor (ch. 3.3).

Otherwise, make the selection by multiplying P_{N2} by $\frac{P_1 \text{ applied}}{P_1 \text{ required}}$.

Calculations can also be made on the basis of torque instead of power; this method is even preferable for low n_2 values.

Verifications

- Verify possible radial loads F_{r1} , F_{r2} by referring to instructions and values given in ch. 3.11 and 3.12.
- When the load chart is available, and/or there are overloads — due to starting on full load (mainly for high inertias and low transmission ratios), braking, shocks, gear reducers in which the low speed shaft becomes driving member due to driven machine inertia, or other static or dynamic causes — verify that the maximum torque peak (ch. 3.13) is always less than $2 \cdot M_{N2}$; if it is higher or cannot be evaluated in the above cases, install a safety device so that $2 \cdot M_{N2}$ will never be exceeded.
- Verify, when $fs < 1$, that torque M_2 is less or equal to M_{N2} value valid for $n_1 \leq 90 \text{ min}^{-1}$ (see ch. 3.5).
- For the cases marked at ch. 7 with * and ** (in red) verify that $P_1 \leq Pt$ (ch. 3.2).

b - Gearmotor

Determining the gearmotor size

- Make available all necessary data: required output power P_2 of gearmotor, speed n_2 , running conditions (nature of load, running time, frequency of starting z , other considerations) with reference to ch. 3.3.
- Determine service factor fs on the basis of running conditions (ch. 3.3).
- Select the gearmotor size on the basis of n_2 , fs and of a power P_1 greater than or equal to P_2 (ch. 3.7).

If power P_2 required is the result of a precise calculation, the gearmotor should be selected on the basis of a power P_1 equal to or greater than $\frac{P_2}{\eta}$, where $\eta = 0,96 \div 0,94$ is gear reducer efficiency (ch. 3.13). The torque value M_2 has been calculated taking into account efficiency.

When for reasons of motor standardization, power P_1 available in catalogue is much greater than the power P_2 required, the gearmotor can be selected on

the basis of a lower service factor ($fs \cdot \frac{P_2 \text{ required}}{P_1 \text{ available}}$) provided it is certain that this excess power available will never be required and frequency of

starting z is low enough not to affect service factor (ch. 3.3).

Calculations can also be made on the basis of torque instead of power; this method is even preferable for low n_2 values.

Verifications

- Verify possible radial load F_{r2} referring to directions and values given in ch. 3.12.
- For the motor, verify frequency of starting z when higher than that normally permissible, referring to directions and values given in ch. 2b; this will normally be required for brake motors only.
- Verify, in case of **motors supplied by the customer**, that the **static bending moment M_b** generated by motor weight on the counter flange of gear reducer is lower than the value allowed M_{bmax} , stated in the ch. 3.13.
Loads higher than permissible loads may be present in dynamical applications where the gearmotor is subjected to translations, rotations or oscillations: consult us for the study of every specific case
- When a load chart is available, and/or there are overloads — due to starting on full load (especially with high inertias and low transmission ratios), braking, shocks, gear reducers in which the low speed shaft becomes driving member due to driven machine inertia, or other static or dynamic causes — verify that the maximum torque peak (ch. 3.13) is always less than $2 \cdot M_{N2}$ ($M_{N2} = M_2 \cdot fs$, see ch. 3.7); if it is higher or cannot be evaluated in the above instances, install suitable safety devices so that $2 \cdot M_{N2}$ will never be exceeded.
- For the cases marked at ch. 3.7 with * and ** (in red) verify that $P_1 \leq Pt$ (ch. 3.2).

c - Combined gear reducer and gearmotor units

Combined units are obtained by coupling together **normal single** gear reducers and/or gearmotors so as to produce low output speeds.

Determining the final gear reducer size and the combined unit

- Make available all necessary data relating to the output of the final gear reducer: required torque M_2 , speed n_2 , running conditions (nature of load, running time, frequency of starting z , other considerations) with reference to ch. 3.3.
- Determine service factor fs on the basis of running conditions (ch. 3.3).
- Select the final gear reducer size and basic reference, and the initial gear reducer or gearmotor size (ch. 3.9) on the basis of a torque value M_{N2} greater than or equal to $M_2 \cdot fs$.

Selection of initial gear reducer or gearmotor

- Calculate the speed n_2 and the required power P_2 at the initial gearmotor output using the following formulae:

$$n_2 \text{ initial} = n_2 \text{ final} \cdot i \text{ final}$$

$$P_2 \text{ initial} = \frac{M_2 \text{ final} \cdot n_2 \text{ final}}{955 \cdot \eta \text{ final}} \text{ [kW]}$$

- In the case of gear reducer, make available input speed n_1 at the input of the initial gear reducer.
- Make the selection of initial gear reducer or gearmotor as shown in ch. 3.4 paragraph a) or b) bearing in mind that sizes are pre-established (and cannot be changed on account of couplings being standard) and that it is not necessary to verify service factor.

Designation for ordering

When ordering combined units, the single gear reducers or gearmotors must be designated **separately**, as indicated in ch. 3.1) bearing in mind the following:

- insert the words **coupled with** between the final gear reducer designation and that of the initial gear reducer or gearmotor;
- always add the words **without motor** to the final gear reducer designation; select the design **oversized B5 flange** for the initial gear reducer or gearmotor (for size 63 also add **-Ø 28**); in case of initial gear reducer or gearmotor size 40 select with flange **FC1A** design.

E.g.: MR 3I 160 UC2A - 38 × 300 - 49,7 without motor coupled with
R 2I 80 UC2A/15,7 oversized B5 flange

UTC 983

MR 3I 125 UC2A - 28 × 250 - 34,1 without motor mounting position V6
coupled with
MR 2I 63 UC2A - 19 × 200 - 24,3
oversized B5 flange - Ø 28, mounting position V6
HB3 80B 4 230.400 B5

Considerations on selection

Motor power

Taking into account the efficiency of the gear reducer, and other drives – if any – motor power is to be as near as possible to the power rating required by the driven machine: accurate calculation is therefore recommended.

The power required by the machine can be calculated, seeing that it is related directly to the power-requirement of the work to be carried out, to friction (starting, sliding or rolling friction) and inertia (particularly when mass and/or acceleration or deceleration are considerable). It can also be determined experimentally on the basis of tests, comparisons with existing applications, or readings taken with ammeters or wattmeters.

An oversized motor would involve: a greater starting current and consequently larger fuses and heavier cable; a higher running cost as power factor ($\cos \varphi$) and efficiency would suffer; greater stress on the drive, causing danger of mechanical failure, drive being normally proportionate to the power rating required by the machine, not to motor power.

Only high values of ambient temperature, altitude, frequency of starting or other particular conditions require an increase in motor power.

Input speed

Maximum input speed must be always $n_1 \leq 2\,800 \text{ min}^{-1}$; for intermittent duty or for particular needs higher speeds may be accepted: consult us.

For n_1 higher than $1\,400 \text{ min}^{-1}$, **power** and **torque** ratings relating to a given transmission ratio vary as shown in the table alongside. In this case no loads should be imposed on the high speed shaft end.

For variable n_1 , the selection should be carried out on the basis of $n_{1 \text{ max}}$; but it should also be verified on the basis of $n_{1 \text{ min}}$.

When there is a belt drive between motor and gear reducer, different input speeds n_1 should be examined in order to select the most suitable unit from engineering and economy standpoints alike (our catalogue favours this method of selection as it shows a number of input speed values n_1 relating to a determined output speed n_{N2} in the same section). Input speed should not be higher than $1\,400 \text{ min}^{-1}$, unless conditions make it necessary; better to take advantage of the transmission, and use an input speed lower than 900 min^{-1} .

n_1 min ⁻¹	R 2I		R 3I	
	P_{N2}	M_{N2}	P_{N2}	M_{N2}
2 800	1,4	0,71	1,7	0,85
2 240	1,25	0,8	1,4	0,9
1 800	1,12	0,9	1,18	0,95
1 400	1	1	1	1

Operation on 60 Hz supply

When motor is fed with 60 Hz frequency (ch. 2 b), the gearmotor specifications vary as follows.

- Speed n_2 increases by 20%.
- Power P_1 may either remain constant or increase (ch. 2 b).
- Torque M_2 and service factor f_s vary as follows:

$$M_{2 \text{ at } 60 \text{ Hz}} = M_{2 \text{ at } 50 \text{ Hz}} \cdot \frac{P_{1 \text{ at } 60 \text{ Hz}}}{1,2 \cdot P_{1 \text{ at } 50 \text{ Hz}}}$$

$$f_{s \text{ at } 60 \text{ Hz}} = f_{s \text{ at } 50 \text{ Hz}} \cdot \frac{1,12 \cdot P_{1 \text{ at } 50 \text{ Hz}}}{P_{1 \text{ at } 60 \text{ Hz}}}$$

Nominal powers and torques (gear reducers)

1) Powers valid for continuous duty S1; **increase** possible for S2... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.
 2) For complete designation when ordering, see ch. 3.

1) Powers valid for continuous duty S1; **increase** possible for S2 ... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.
 2) For complete designation when ordering, see ch. 3.

Motor (cat. TX) with efficiency value not according to IE3 class (IEC 60034-30); the nominal power and nameplate data refer to intermittent duty S3 70%.

1) Powers valid for continuous duty S1; **increase** possible for S2 ... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.

2) For complete designation when ordering, see ch. 3.

* Mounting position **B5R** (see table ch. 2b).

Motor (cat. TX) with efficiency value not according to IE3 class (IEC 60034-30); the nominal power and nameplate data refer to intermittent duty S3 70%.

1) Powers valid for continuous duty S1; increase possible for S2 ... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.
2) For complete designation when ordering, see ch. 3.

* Mounting position **B5R** (see table ch. 2b).

** Mounting position **B5A** (see table ch. 2b).

Motor (cat. TX) with efficiency value not according to IE3 class (IEC 60034-30); the nominal power and nameplate data refer to intermittent duty S3 70%.

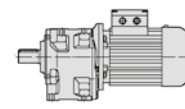

1) Powers valid for continuous duty S1; increase possible for S2 ... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.

2) For complete designation when ordering, see ch. 3.

* Mounting position BSR (see table ch. 2b).

** Mounting position B5A (see table ch. 2b).

Motor (cat. TX) with efficiency value not according to IE3 class (IEC 60034-30); the nominal power and nameplate data refer to intermittent duty S3 70%.

1) Powers valid for continuous duty S1; increase possible for S2 ... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.

2) For complete designation when ordering, see ch. 3.

* Mounting position B5R (see table ch. 2b).

Motor (cat. TX) with efficiency value not according to IE3 class (IEC 60034-30); the nominal power and nameplate data refer to intermittent duty S3 70%.

1) Powers valid for continuous duty S1; increase possible for S2 ... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.
2) For complete designation when ordering, see ch. 3.

* Mounting position B5R (see table ch. 2b).

1) Powers valid for continuous duty S1; **increase** possible for S2 ... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.
2) For complete designation when ordering, see ch. 3.

* Mounting position **B5R** (see table ch. 2b).

Motor (cat. TX) with efficiency value not according to IE3 class (IEC 60034-30); the nominal power and nameplate data refer to intermittent duty S3 70%.

1) Powers valid for continuous duty S1; increase possible for S2 ... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.
2) For complete designation when ordering, see ch. 3.

Motor (cat. TX) with efficiency value not according to IE3 class (IEC 60034-30); the nominal power and nameplate data refer to intermittent duty S3 70%.

1) Powers valid for continuous duty S1; **increase** possible for S2 ... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.
2) For complete designation when ordering, see ch. 3.

* Mounting position **B5R** (see table ch. 2b).

Motor (cat. TX) with efficiency value not according to IE3 class (IEC 60034-30); the nominal power and nameplate data refer to intermittent duty S3 70%.

1) Powers valid for continuous duty S1; increase possible for S2... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.

2) For complete designation when ordering, see ch. 3.

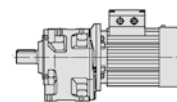

* Mounting position B5R (see table ch. 2b).

Motor (cat. TX) with efficiency value not according to IE3 class (IEC 60034-30); the nominal power and nameplate data refer to intermittent duty S3 70%.

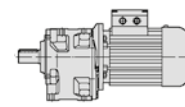

1) Powers valid for continuous duty S1; increase possible for S2... S10 (ch. 2b) in which case P_2 and M_2 increase and f_s decreases proportionately.
2) For complete designation when ordering, see ch. 3.

1) Powers valid for continuous duty S1; **increase** possible for S2 ... S10 (ch. 2b) in which case M_2 increases and f_s decreases proportionately.

2) For complete designation when ordering, see ch. 3.

* Mounting position **B5R** (see table ch. 2b).

* In case of ambient temperature > 30 °C check the thermal power (ch. 4).

** Check the thermal power.

For initial gear reducer or gearmotor performance data see ch. 3.5 and 3.7.

1) Final gearmotor has a 160 mm motor mounting flange (see dimension P_0 ch. 3.8).

2) Gear reducer in design «Oversized B5 flange» (see ch. 5); moreover, size 63 has the low speed shaft reduced to 28 mm: «Oversized B5 flange - Ø 28».

3) Provided that f_s is always $\geq 0,8$, it can be reduced by **1,06** for $n_2 = 2,8 \rightarrow 0,71 \text{ min}^{-1}$, by **1,12** for $n_2 \leq 0,71 \text{ min}^{-1}$.

Combined unit dimensions ¹⁾

MR 3I 63 ... 81 + R 2I, 3I ...

MR 3I 100 ... 180 + R 2I, 3I ...

1) For design, mounting position and lubricant quantity of single gear reducers, see ch. 3.6 and 3.8.

Notes of page 65.

1) For high speed shaft or motor shaft H is -15 mm, H_0 +15 mm.

2) For high speed shaft or motor shaft H is -8 mm, H_0 +8 mm.

3) For high speed shaft or motor shaft H is -29 mm, H_0 +29 mm.

4) Values valid for brake motor.

5) Values valid for gearmotor without motor.

See notes on page 52.

Radial loads generated on the shaft end by a drive connecting gear reducer and motor must be less than or equal to those given in the relevant table.

The radial load F_{r1} given by the following formula refers to most common drives:

$$F_{r1} = \frac{2865 \cdot P_1}{d \cdot n_1} \text{ [daN]} \quad \text{for timing belt drive}$$

$$F_{r1} = \frac{4775 \cdot P_1}{d \cdot n_1} \text{ [daN]} \quad \text{for V-belt drive}$$

where: P_1 [kW] is power required at the input side of the gear reducer, n_1 [min^{-1}] is the speed, d [m] is the pitch diameter.

Radial loads given in the table are valid for overhung loads on centre line of high speed shaft end, i.e. operating at a distance of $0,5 \cdot e$ (e = shaft end length) from the shoulder. If they operate at $0,315 \cdot e$ multiply by 1,25; if they operate at $0,8 \cdot e$ multiply by 0,8.

1) An axial load of up to 0,2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.

IMPORTANT: tabulated values for radial load F_{r1} can increase considerably in certain instances (direction of rotation, angular position of load, etc.). **Consult us** if need be.

Radial F_{r2} [daN] or axial loads F_{a2} [daN] on low speed shaft end 3.12

Axial loads F_{a2}

Permissible F_{a2} is shown in the column where direction of rotation of low speed shaft (black or white arrow) and direction of the axial force (solid or broken arrow) correspond to those of the gear reducer in question.

Wherever possible, choose the load conditions corresponding to the **column** with **highest** admissible values.

Radial loads F_{r2}

Radial loads generated on the shaft end by a drive connecting gear reducer and machine must be less than or equal to those given in the relevant table.

Normally, radial loads on low speed shaft ends are considerable: in fact there is a tendency to connect the gear reducer to the machine by means of a transmission with high transmission ratio (economizing on the gear reducer) and with small diameters (economizing on the drive, and for requirements dictated by overall dimensions).

Bearing life and wear (which also affect gears unfavourably) and low speed shaft strength, clearly impose limits on permissible radial load.

The high value which radial load may take on, and the importance of not exceeding permissible values, make it necessary to take full advantage of the gear reducer's possibilities.

Permissible radial loads given in the table are therefore based on: the product of speed n_2 [min^{-1}] multiplied by bearing life L_n [h] required, the direction of rotation, the angular position φ [$^\circ$] of the load and torque M_2 [daN m] required.

Radial loads given in the table are valid for overhung loads on centre line of low speed shaft end, i.e. operating at a distance of $0,5 \cdot E$ (E = shaft end length) from the shoulder. If operating at $0,315 \cdot E$ multiply by 1,25; if operating at $0,8 \cdot E$ multiply by 0,8.

Radial F_{r2} [daN] or axial loads F_{a2} [daN] on low speed shaft end 3.12

Radial load F_{r2} for most common drives has the following value and angular position:

$$F_{r2} = \frac{1\,910 \cdot P_2}{d \cdot n_2} \text{ [daN]}$$

for chain drive (lifting in general); for timing belt drive replace 1 910 with 2 865

$$F_{r2} = \frac{4\,775 \cdot P_2}{d \cdot n_2} \text{ [daN]}$$

for V-belt drive

$$F_{r2} = \frac{2\,032 \cdot P_2}{d \cdot n_2} \text{ [daN]}$$

for spur gear pair drive

$$F_{r2} = \frac{6\,781 \cdot P_2}{d \cdot n_2} \text{ [daN]}$$

for friction wheel drive (rubber-on-metal)

where: P_2 [kW] is power required at the output side of the gear reducer, n_2 [min^{-1}] is the speed, d [m] is the pitch diameter.

IMPORTANT: 0° coincides with a half line parallel to the bolted base of the housing as shown above, and therefore it follows the rotation of the housing, as shown below.

In the flanged design (sizes 32 ... 41), 0° remains in the same position, as per the same shape of the housing.

1) An axial load of up to 0,2 times the value in the table is permissible, simultaneously with the radial load and vice versa. If exceeded consult us.
 2) An unfavourable direction of load can limit F_{r2} to $0,9 \cdot F_{r2max}$

Radial F_{r2} [daN] or axial loads F_{a2} [daN] on low speed shaft end 3.12

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load and vice versa. If exceeded consult us.
 2) An unfavourable direction of load can limit F_{r2} to $0,9 \cdot F_{r2max}$

Efficiency η :

– gear reducer with 2 gear pairs (2l) 0,96, with 3 gear pairs (3l) 0,94; for $M_2 \ll M_{N2}$, η could considerably decrease; consult us.

Overloads

Where a gear reducer is subjected to high static and dynamic overloads, the need arises for verifying that such overloads will always remain lower than $2 \cdot M_{N2}$ (see ch. 3.5; see ch. 3.7 where $M_{N2} = M_2 \cdot fs$).

Overloads are normally generated when one has:

- starting on full load (especially for high inertias and low transmission ratios), braking, shocks;
- gear reducers in which the low speed shaft becomes driving member due to driven machine inertia;
- applied power higher than that required; other static or dynamic causes.

The following general observations on overloads are accompanied by some formulae for carrying out evaluations in certain typical instances.

Where no evaluation is possible, install safety devices which will keep values within $2 \cdot M_{N2}$.

Starting torque

When starting on full load (especially for high inertias and low transmission ratios) verify that $2 \cdot M_{N2}$ is equal to or greater than starting torque, by using the following formula:

$$M_2 \text{ start} = \left(\frac{M \text{ start}}{M_N} \cdot M_2 \text{ available} - M_2 \text{ required} \right) \frac{J}{J + J_0} + M_2 \text{ required}$$

where:

M_2 required is torque absorbed by the machine through work and frictions;

M_2 available is output torque due to the motor's nominal power;

J_0 is the moment of inertia (of mass) of the motor;

J is the external moment of inertia (of mass) in kg m^2 (gear reducers, couplings, driven machine) referred to the motor shaft;

for other symbols see ch. 2b.

NOTE: when seeking to verify that starting torque is sufficiently high for starting, take into account starting friction, if any, in evaluating M_2 required.

Stopping machines with high kinetic energy (high moments of inertia combined with high speeds) with brake motor

Verify braking stress by means of the formula:

$$\left(\frac{Mf}{\eta} \cdot i + M_2 \text{ required} \right) \frac{J}{J + J_0} - M_2 \text{ required} \leq 2 \cdot M_{N2}$$

where:

Mf is the braking torque setting (see table in ch. 2b); for other symbols see above and ch. 1.

Operation with brake motor

Starting time t_a and revolutions of motor φ_{a_1}

$$t_a = \frac{(J_0 + J) \cdot n_1}{95,5 \left(M \text{ start} - \frac{M_2 \text{ required}}{i} \right)} \text{ [s];} \quad \varphi_{a_1} = \frac{t_a \cdot n_1}{19,1} \text{ [rad]}$$

Braking time t_f and revolutions of motor φ_{f_1}

$$t_f = \frac{(J_0 + J) \cdot n_1}{95,5 \left(Mf + \frac{M_2 \text{ required}}{i} \right)} \text{ [s];} \quad \varphi_{f_1} = \frac{t_f \cdot n_1}{19,1} \text{ [rad]}$$

where:

$M \text{ start}$ [daN m] is motor starting torque $\left(\frac{955 \cdot P_1}{n_1} \cdot \frac{M \text{ start}}{M_N} \right)$ (see ch. 2b);

Mf [daN m] is the braking torque setting of the motor (see ch. 2b);

for other symbols see above and ch. 1.

Assuming a regular air-gap and ambient humidity, and utilizing suitable electrical equipment, repetition of the braking action, as affected by variation in temperature of the brake and by the state of wear of friction surface, is approx $\pm 0,1 \cdot \varphi_{f_1}$.

Duration of friction surface

As a rough guide, the number of applications permissible between successive adjustments of the air-gap is given by the formula:

$$\frac{W \cdot 10^5}{Mf \cdot \varphi_{f_1}}$$

where:

W [MJ] is the work of friction between successive adjustments of the airgap as indicated in the table; for other symbols see above.

The air-gap should measure between 0,25 minimum and 0,6 maximum; as a rule, 5 adjustments can be made.

Low speed shaft angular backlash and torsional stiffness

A rough guide for the angular backlash (high speed shaft being locked) is given in the table. Values vary according to temperature and transmission ratio.

Also the **approx.** values for low speed shaft torsional stiffness — high speed shaft being locked — are given in the table according to the train of gears.

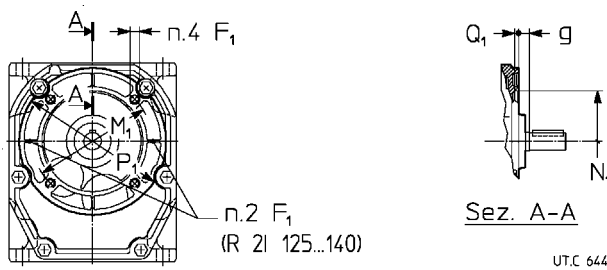

On request it is possible to supply gear reducers with **reduced backlash** (sizes 32 ... 41 excluded) lower than or equal to the minimum values stated on the table.

1) At the distance of 1 m from the low speed shaft centre, angular backlash in mm is obtained by multiplying the value stated in the table by 1 000 (1 rad = 3438').

Gear reducers input face

The input face of gear reducers (size ≥ 50) has a flange with tapped holes and «hole» centering for eventual fitting of motor support, etc. The use of threaded holes closed with dowel, if any, requires the removal of dowel (avoiding eventual oil loss) and the readjustment of sealant.

Grand. riduttore Gear reducer size	F ₁	g	M ₁ ∅	N ₁ ∅ H7	P ₁ ∅	Q ₁

Plug position

Maximum bending moment of flange MR

In case of assembly of motors supplied by the customer, verify that the static bending moment M_b generated by motor weight on the counter flange of gear reducer is lower than the value allowed M_{bmax} , stated in the table:

$$M_b \leq M_{bmax}$$

where:

$$M_b = G \cdot (X + HF) / 1000 \text{ [daN m]}$$

G [daN] motor weight; numerically nearly equal to motor mass, expressed in kg

X [mm] distance from motor center of gravity from flange surface

HF [mm] given in the table, according to gear reducer size and flange diameter P_1 .

Very long and thin motors, though with bending moments within the prescribed limits, may generate anomalous vibrations during the operation. In these cases it is necessary to foresee a proper additional motor support (see motor specific documentation).

Loads higher than permissible loads may be present in dynamical applications where the gearmotor is subjected to translations, rotations or oscillations: consult us for the study of every specific case

Installation and maintenance

Section content

4.1	General	84
4.2	Lubrication	85
4.3	Motor replacement	86
4.4	Systems of motor-gear reducer mounting	87

4.1 - General

Be sure that the structure on which gear reducer or gearmotor is fitted is plane, levelled and sufficiently dimensioned in order to assure fitting stability and vibration absence, keeping in mind all transmitted forces due to the masses, to the torque, to the radial and axial loads.

Position the gear reducer or gearmotor so as to allow a free passage of air for cooling both gear reducer and motor (especially at motor fan side).

Avoid: any obstruction to the air-flow; heat sources near the gear reducer that might affect the temperature of cooling-air and of gear reducer for radiation; insufficient air recycle or any other factor hindering the steady dissipation of heat.

Mount the gear reducer so as not to receive vibrations.

When external loads are present use pins or locking blocks, if necessary.

When fitting gear reducer and machine and/or gear reducer and eventual flange **B5** it is recommended to use **locking adhesives** such as LOCTITE on the fastening screws (also on flange mating surfaces).

For outdoor installation or in a hostile environment protect the gear reducer or gearmotor with anticorrosion paint. Added protection may be afforded by water-repellent grease (especially around the rotary seating of seal rings and the accessible zones of shaft end).

Gear reducers and gearmotors should be protected wherever possible, and by whatever appropriate means, from solar radiation and extremes of weather; weather protection **becomes essential** when high or low speed shafts are vertically disposed, or where the motor is installed vertical with fan uppermost.

For ambient temperatures greater than 40 °C or less than 0 °C, consult us.

Before wiring-up the gearmotor, make sure that motor voltage corresponds to input voltage. If the direction of rotation is not as desired, invert two phases at the terminals.

Star-delta starting should be adopted for starting on no load (or with a very small load) and/or when the necessity is for smooth starts, low starting current and limited stresses.

If overloads are imposed for long periods of time, or if shocks or danger of jamming are envisaged, then motor-protections, electronic torque limiters, fluid couplings, safety couplings, control units or other suitable devices should be fitted.

Where duty cycles involve a high number of starts on-load, it is advisable to utilize **thermal probes** (fitted on the wiring) for motor protection; a thermal overload relay is unsuitable since its threshold must be set higher than the motor's nominal current rating.

Use varistors to limit voltage peaks due to contactors.

Warning! Bearing life, good shaft and coupling running depend on alignment precision between the shafts. Carefully align the gear reducer with the motor and the driven machine (with the aid of shims if need be), interposing flexible couplings whenever possible.

Whenever a leakage of lubricant could cause heavy damages, increase the frequency of inspections and/or envisage appropriate control devices (e.g.: remote oil level gauge, lubricant for food industry, etc.).

In polluting surroundings, take suitable precautions against lubricant contamination through seal rings or other.

Gear reducer or gearmotor should not be put into service before it has been incorporated on a machine which is conform to 2006/42/EC directive.

For brake or non-standard motors, consult us for specific information.

Fitting of components to shaft ends

It is recommended that the bore of parts keyed to shaft ends is machined to H7 tolerance; for low speed shaft ends, tolerance must be **K7** when load is not uniform and light. Other details are given in the «Shaft end» table (ch. 3.13).

Before mounting, clean mating surfaces thoroughly and lubricate against seizure and fretting corrosion.

Installing and removal operations should be carried out with **pullers** and **jacking screws** using the tapped hole at the shaft butt-end; for H7/m6 and K7/j6 fits it is advisable that the part to be keyed is pre-heated to a temperature of 80 ÷ 100 °C.

4.2 - Lubrication

Gear pairs and bearings are oil-bath or splash lubricated excluding sizes 32 ... 41 which are grease lubricated.

Sizes 32 ... 41: gear reducers are supplied **filled with synthetic grease** (SHELL Gadus S5, MOBIL SHX Polyrex 005), providing lubrication «for life» – assuming pollution-free surroundings.

Sizes 50 ... 81: gear reducers are supplied **filled with synthetic oil** (KLÜBER Klübersynth GH 6-220, MOBIL Glygoyle 220, SHELL Omala S4 WE 220) providing lubrication «for life» – assuming pollution-free surroundings. Ambient temperature range $0 \div 40$ °C with peaks of -20 °C and +50 °C.

Important verify mounting position keeping in mind that if gear reducer is installed in a mounting position which differs from the one indicated on the name plate, it could require the addition of the difference between the two quantities of lubricant given in ch. 3.6 and 3.8, by way of the housing filler hole.

Sizes 100 ... 180: gear reducers are supplied **without oil**; before putting into service, fill to the specified level with **mineral oil** having the ISO viscosity grade given in the table.

1) Lubricant quantities stated on ch. 3.6 and 3.8 are approximate for provisioning. The exact oil quantity the gear reducer is to be filled with is definitely given by the level.

When it is required to increase oil change interval («long life»), the ambient temperature range, and/or reduce oil temperature, use **synthetic oil** with polyalphaolefines basis (PAO), always suggested, or with polyglycol basis (PAG) having ISO viscosity grade as indicated in the table.

Manufacturer	PAO synthetic oil	PAG synthetic oil	Mineral Oil
AGIP	Blasia SX	Blasia S	Blasia
ARAL	Degol PAS	Degol GS	Degol BG
BP	Enersyn EPX	Enersyn SG-XP	Energol GR XP
CASTROL	Alphasyn EP	Optiflex A	Alpha SP
FUCHS	Renolin Unisys	Renolin PG	CLP Renolin CLP
KLÜBER	Klübersynth GEM4	Klübersynth GH6	Klüberoil GEM1
MOBIL	Mobil SHC Gear	Mobil Glygoyle	Mobilgear 600 XP
SHELL	Omala S4 GX	Omala S4 WE	Omala S2 G
TEXACO	Pinnacle	Synlube CLP	Meropa
TOTAL	Carter SH	Carter SY	Carter EP

ISO viscosity grade

Mean kinematic viscosity [cSt] at 40 °C.

Speed n_2 min ⁻¹	Ambient temperature ²⁾ [°C]		
	mineral oil		synthetic oil
	0 ÷ 20	10 ÷ 40	0 ÷ 40
> 224	150	150	150
224 ÷ 22,4	150	220	220
22,4 ÷ 5,6	220	320	320
< 5,6	320	460	460

2) Peaks of 10 °C above and 10 °C (20 °C for synthetic oil) below the ambient temperature range are acceptable.

An overall guide to **oil-change interval** is given in the table, and assumes pollution-free surroundings. Where heavy overloads are present, halve the values.

Oil temperature [°C]	Oil-change interval [h]	
	mineral oil	synthetic oil
≤ 65	8 000	25 000
65 ÷ 80	4 000	18 000
80 ÷ 95	2 000	12 500

Combined gear reducer and gearmotor units: lubrication remains independent, thus data relative to each single gear reducer hold good.

Seal rings: duration depends on several factors such as dragging speed, temperature, ambient conditions, etc.; as a rough guide; it can vary from 3 150 to 12 500 h.

Warning: for gear reducers sizes 100 ... 180, before unscrewing the filler plug with valve (symbol ) wait until the unit has cooled and then open with caution.

4.3 - Motor replacement

Motor size	Min dynamic load capacity [daN]		Max dimension 'S' mm
	Front	Rear	
63	450	335	16
71	630	475	18
80	900	670	20
90	1 320	1 000	22,5
100	2 000	1 500	25
112	2 500	1 900	28
132	3 550	2 650	33,5
160	4 750	3 350	37,5
180	6 300	4 500	40
200	8 000	5 600	45
225	10 000	7 100	47,5
250	12 500	9 000	53
280	16 000	11 200	56

As all gearmotors are fitted with **standard** motors, motor replacement is extremely easy. Simply observe the following instructions:

- be sure that the mating surfaces are machined under accuracy rating (IEC 60072-1);
- clean surfaces to be fitted thoroughly;
- check that the fit-tolerance (push-fit) between hole and shaft end is K6/j6 for $D \leq 28$ mm, J6/k6 for $D \geq 38$ mm;
- in the event of a lowered keyway, replace the motor keyway with the one supplied with the gear reducer; adjust the keyway length to the motor shaft, if need be.; check that between the top and the bottom of the hole keyway there is a backlash of $0,1 \div 0,2$ mm; in the event of output shaft keyway, lock the key by pins;
- make sure that the motors have bearing location and overhang (distance S) as shown in the table;
- make sure that the motors have bearing location and overhang (distance S) as shown in the table;
- assemble on motor shaft, as follows:
 - the **spacer** pre-heated at **65 °C** sealing the motor shaft part with **locking adhesive type LOXEAL 58-14** and ensuring that between keyway and motor shaft shoulder there is a ground helical section of at least 1,5 mm; pay attention **not to damage the external surface** of spacer;
 - **the key** in the keyway, taking care that a brief segment of at least 0,9 times the pinion width;
 - the pinion pre-heated at **80 ÷ 100 °C**;
 - **the axial fastening system** where foreseen (head self-locking screw with base, spacer, or hub clamp with one or more dowels, fig. a); for the cases foreseen **without axial fastening** (fig. b), seal with **locking adhesive type LOXEAL 58-14** also the motor shaft section below the **pinion**;
- in the event of axial fastening system with hub clamp and dowels, be sure that these ones do not overhang from spacer external surface: screw the dowel and matrix the motor shaft with a tip;
- grease the pinion teeth, the sealing ring rotary seat and the seal ring (with KLÜBER Petamo GHY 133N), and assemble carefully, **paying attention not to damage the seal ring lip due to accidental shock with the pinion toothings.**

4.4 - Systems of motor-gear reducer mounting

Accessories and non-standard designs

Section content

5.1	Strengthened high speed shaft bearings	90
5.2	Non-standard low speed shaft end	90
5.3	Oversized B5 flange (low speed shaft)	90
5.4	Design for agitators and aerators	91
5.5	Gear reducer design ATEX II 2GD and 3 GD	91
	Miscellaneous	93

5.1 - Strengthened high speed shaft bearings

Gear reducer R 2I sizes 50, 63, 80 and sizes 51, 64, 81 with $i_N \geq 16$ and R 3I sizes 63 ... 101 can be supplied with cylindrical roller bearings on high speed shaft so as to allow high radial loads, values **x 1,6** (ch. 13); this design is standard for all remaining gear reducers, which present cylindrical roller or taper roller bearings as a standard.

Supplementary description when ordering by **designation: strengthened high speed shaft bearings.**

5.2 - Non-standard low speed shaft end

The gear reducers and gearmotors size 40 ... 101 can be supplied with non-standard low speed shaft end; dimensions as per following table.

Gear reducer size	D Ø	E	d Ø	Keyway b x h x l
40 ¹⁾	20 g6	40	M6	6 x 6 x 36
41	20 j6	36	M6	6 x 6 x 25

101	50 k6	82	M12	14 x 9 x 70

1) Shaft end without shoulder.

Supplementary description when ordering by **designation: nonstandard low speed shaft end, D ...** (dimension D Ø).

5.3 - Oversized B5 flange (low speed shaft)

All gear reducers and gearmotors (sizes ≥ 50) can be supplied with oversized B5 flange (always having through holes) supplied separately (complete with stud bolts) or fitted on standard B5 flange – if indicated when ordering –. Flange plane coincides with low speed shaft end shoulder.

The gear reducer is to be fastened after having fastened the flange on the machine.

Locking adhesives such as LOCTITE, should be used both on screws and coupling surfaces.

Gear reducer size	F Ø	M Ø	N Ø h6	P Ø	Q	S	S ₁ 1)

1) Screw type UNI 5931-84

Supplementary description when ordering by **designation: oversized B5 flange.**

5.4 - Design for agitators and aerators

This design has been specifically developed for aerators and agitators.

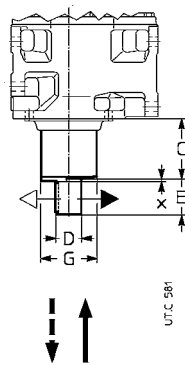

In addition to the rigid and precise **single-piece** housing, **universal** mounting, taper roller bearings (sizes 125 ... 180), the main features of this **reliable compact and economic** design are:

- extended bearing housing to improve radial and axial load ratings (sizes ≥ 125 : taper roller bearings) and to reduce overhangs;
- plentiful low speed shaft end diameter;
- double seals on the low speed shaft with chromium plated raceway;
- space between double seals packed with grease and top hat arrangement which acts as water splash guard for aerators;
- **oil** lubricated bearing on low speed shaft end side; additional stainless steel drain plug to facilitate complete oil drainage; all this ensures **total reliability** (gear pairs and bearings) during running and **minimum maintenance**;
- special single compound paint: antirust zinc primer plus blue RAL 5010 DIN 1843 synthetic paint.

Options:

- drip proof cover for motor (standard protection IP 55);
- special dual compound paint;
- remote oil level and/or oil temperature indicator with threshold signal (sizes ≥ 160).
- oversized B5 flange.

Axial load F_{a2} on low speed shaft end can be doubled according to direction of rotation for combinations **2** (as shown in the ch. 3.12 and in table) which are to be **preferred**; (for sizes 81 and 101 consult us for values of F_{a2}).

Gear reducer size	C	D Ø	E	G Ø	x = 1)	Axial load F_{a2}

1) Thickness of protection disc.

Supplementary description when ordering by **designation: design for agitators**.

5.5 Gear reducer design ATEX II 2 GD and 3 GD

Coaxial gear reducers and gearmotors (sizes 32 ... 41 excluding) may be supplied according to European Community Directive ATEX 2014/34/EU in order to be used in potentially explosive atmospheres:

- category **2 GD** (for operation in zones 1 (G = gas), 21 (D = dust); **probable** presence of explosive atmosphere) and **3 GD** (for operation in zones 2 (gas), 22 (dust): **improbable** presence of explosive atmosphere) - with surface temperature $T \leq 135^\circ\text{C}$ (T4).

These are the main variations of the product:

- fluoro-rubber seal rings;
- metal plugs; filler plug with filter and valve;
- special name plate with ATEX mark and indication of application limits.
- external protection tested on a water-soluble dual-compound polyurethane **conductive** enamel, **color grey** RAL 7040, corrosivity class C3 ISO 12944-2;
- «ATEX instructions» manual.

For category 2 GD, depending on **minimum control intervals**, also:

- 2 GD monthly control
- double seal rings on low speed shaft;
- 2 GD quarterly control (size 100 ... 180)
- double seal rings on low speed shaft;
- oil temperature probe;
- bearing temperature probe, if any;

this solution is advisable when the gear reducer has difficult acces or when a decrease in control frequency is required.

Operating ambient temperature: $-20 \pm +40^\circ\text{C}$.

The «**ATEX operating instructions**» (with the additional documentation, if any) are **integral part of the supply** of each gear reducer; every indication stated in it must be carefully applied. In case of needs, consult us.

Gear reducer size selection

Determine the size of gear reducer as indicated in ch. 5 considering following additional limitations:

- maximum input speed $n_1 \leq 1\,500 \text{ min}^{-1}$;
- **service factor requested** determined according to ch. 3.4 increased with the factors stated in following table - **never lower than 1**.

Verify, at last, that the applied power P_1 is lower than or equal to nominal thermal power P_{tn} multiplied by thermal factors $f_{t2} \dots f_{t5}$ (see ch 4) and by corrective factor f_{ATEX} given in the following table.

ATEX design **corrective factors** for required service factor f_s and nominal thermal power P_{tn} .

Categoria ATEX - ATEX Category	f_{sATEX}	f_{ATEX}
2 GD	1,18	0,8
3 GD	1,06	0,9

Motor category selection

In the table on the right the minimum features of motors to be installed with Rossi gear reducers in ATEX design, in potentially explosive atmosphere areas.

Protection methods of electric tools:

- EEEx **e** increased safety;
- EEEx **d** flameproof enclosure;
- EEEx **de** combination of «d» and «e»;
- EEEx **nA** reduced sparking

Zona Zone	Riduttore Rossi in esecuzione ATEX II Rossi Gear reducer ATEX II design	Categoria motore richiesta ¹⁾ Required motor category ¹⁾
1	2 GD	2 G EEEx e 2 G EEEx d 2 G EEEx de con termistori o Pt100
21		2 D IP65
1, 21		2 GD EEEx e 2 GD EEEx d 2 GD EEEx de with thermistors or Pt100
2	3 GD	3 G EEEx nA –
22		3 D IP54 ²⁾ –
2, 22		3 GD EEEx nA

1) The devices suitable for zone 1 are also suitable for zone 2, similarly the devices suitable for zone 21 are also suitable for zone 22.

2) For conductive dusts motor must be 2 D IP65.

Supplementary description when ordering by **designation**¹⁾:
design ATEX II ...

- ... **3 GD T4** sizes 50 ... 180
- ... **2 GD T4 monthly control** sizes 50 ... 180
- ... **2 GD T4 quarterly control** sizes 100 ... 180

1) For gearmotors, this designation refers to the only **gear reducer part**.

Miscellaneous

- Gearmotors with:
 - **brake motor** (also single-phase) with d.c. **safety and/or parking brake** (sizes 63 ... 132) having overall dimensions nearly the same of a standard motor and braking torque $M_f \geq M_N$, maximum economy; **suitable for running with inverter**, non-standard designs with axial independent cooling fan and/or encoder (see ch. 2b);
 - **two-speed motor** (standard, brake motor, brake motor with safety brake and/or parking brake, with flywheel) with 2.4, 2.6, 2.8, 2.12, 4.6, 4.8, 6.8 poles;

- motor featuring: d.c. supply; single-phase; explosion-proof; with second shaft end; with non-standard protection, voltage and frequency; provided with devices against overloads and overheating;
- **motor without fan** externally cooled **by natural convection** (sizes 63 ... 112); design for textile industry.

– **MLA unit, mechanical torque limiter on input shaft**, motor sizes **80 ... 200**.

Mechanical torque limiter unit to be interposed between gear reducer and B5 mounting position motor standardized to IEC (or wide belt or planetary motor-variator) or, in **combined units**, between the initial gear reducer and the final gear reducer.

Axially ultra-compact design: excellent load bearing with life lubricated double row angular contact ball bearings (motor size ≤ 112) or «O» disposed taper roller bearings.

The unit protects the drive from accidental overloads by excluding inertia loads transmitted from up-line masses and down-line masses.

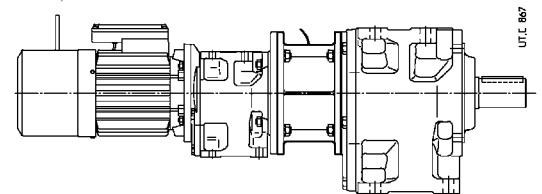

LA unit is friction type (friction surfaces without asbestos). When the transmitted torque tends to exceed the setting, the drive «slips» although **it remains** engaged and transmits torque equal to the limiter setting value; slipping stops as soon as the load returns to normal; in the case of very brief overloads the driven machine will continue normal operation (after decelerating or stopping) without requiring reset procedures.

friction

MLA
mounted between gear reducer
and motor or motor-variator

MLA
mounted onto combined units

* on request

- Gearmotors with interposed compact clutch-brake or fluid coupling/brake unit.
- Semi-flexible low speed shaft couplings.
- Special paint options:
 - **external, single-compound:** antirust zinc primer plus blue RAL 5010 DIN 1843 synthetic paint (excluding 32 ... 41);
 - **external, dual-compound:** dual-compound epoxy-polyamidic antirust primer plus dual-compound blue RAL 5010 DIN 1843 polyurethane enamel;
 - **internal, dual-compound:** unaffected by polyglycol synthetic oils (sizes 100 ... 180).
- Special seal rings; double seal.

Technical formulae

Main formulae concerning mechanical drives, according to the Technical System and International Unit System (SI).

Size	Con unità Sistema Tecnico With Technical System units	Con unità SI With SI units
starting or stopping time as a function of an acceleration or deceleration, of a starting or braking torque	$t = \frac{Gd^2 \cdot n}{375 \cdot M} [s]$	$t = \frac{J \cdot \omega}{M} [s]$
velocity in rotary motion	$v = \frac{\pi \cdot d \cdot n}{60} = \frac{d \cdot n}{19,1} [m/s]$	$v = \omega \cdot r [m/s]$
speed n and angular velocity ω	$n = \frac{60 \cdot v}{\pi \cdot d} = \frac{19,1 \cdot v}{d} [min^{-1}]$	$\omega = \frac{v}{r} [rad/s]$
acceleration or deceleration as a function of starting or stopping time		$a = \frac{v}{t} [m/s^2]$
angular acceleration or deceleration as a function of a starting or stopping time, of a starting or braking torque	$\alpha = \frac{n}{9,55 \cdot t} [rad/s^2]$ $\alpha = \frac{39,2 \cdot M}{Gd^2} [rad/s^2]$	$\alpha = \frac{\omega}{t} [rad/s^2]$ $\alpha = \frac{M}{J} [rad/s^2]$
starting or stopping distance as a function of an acceleration or deceleration, of a final or initial velocity		$s = \frac{a \cdot t^2}{2} [m]$ $s = \frac{v \cdot t}{2} [m]$
starting or stopping angle as a function of an angular acceleration or deceleration, of a final or initial angular velocity	$\varphi = \frac{n \cdot t}{19,1} [rad]$	$\varphi = \frac{\omega \cdot t}{2} [rad]$
mass	$m = \frac{G}{g} [\frac{kgf \cdot s^2}{m}]$	m è l'unità di massa [kg] m is the unit of mass [kg]
weight (weight force)	G è l'unità di peso (forza peso) [kgf] $G = m \cdot g [N]$ G is the unit of weight (weight force) [kgf]	
force in vertical (lifting), horizontal, inclined motion of translation (μ = coefficient of friction; φ = angle of inclination)	$F = G [kgf]$ $F = \mu \cdot G [kgf]$ $F = G (\mu \cdot \cos \varphi + \sin \varphi) [kgf]$	$F = m \cdot g [N]$ $F = \mu \cdot m \cdot g [N]$ $F = m \cdot g (\mu \cdot \cos \varphi + \sin \varphi) [N]$
dynamic moment Gd², moment of inertia J due to a motion of translation (numerically $J = \frac{Gd^2}{4}$)	$Gd^2 = \frac{365 \cdot G \cdot v^2}{n^2} [kgf \cdot m^2]$	$J = \frac{m \cdot v^2}{\omega^2} [kg \cdot m^2]$
torque as a function of a force, of a dynamic moment or of a moment of inertia, of a power	$M = \frac{F \cdot d}{2} [kgf \cdot m]$ $M = \frac{Gd^2 \cdot n}{375 \cdot t} [kgf \cdot m]$ $M = \frac{716 \cdot P}{n} [kgf \cdot m]$	$M = F \cdot r [N \cdot m]$ $M = \frac{J \cdot \omega}{t} [N \cdot m]$ $M = \frac{P}{\omega} [N \cdot m]$
work, energy in motion of translation, in rotary motion	$W = \frac{G \cdot v^2}{19,6} [kgf \cdot m]$ $W = \frac{Gd^2 \cdot n^2}{7160} [kgf \cdot m]$	$W = \frac{m \cdot v^2}{2} [J]$ $W = \frac{J \cdot \omega^2}{2} [J]$
power in motion of translation, in rotary motion	$P = \frac{F \cdot v}{75} [CV]$ $P = \frac{M \cdot n}{716} [CV]$	$P = F \cdot v [W]$ $P = M \cdot \omega [W]$
power available at the shaft of a single-phase motor ($\cos \varphi$ = power factor)	$P = \frac{U \cdot I \cdot \eta \cdot \cos \varphi}{736} [CV]$	$P = U \cdot I \cdot \eta \cdot \cos \varphi [W]$
power available at the shaft of a three-phase motor	$P = \frac{U \cdot I \cdot \eta \cdot \cos \varphi}{425} [CV]$	$P = 1,73 \cdot U \cdot I \cdot \eta \cdot \cos \varphi [W]$

Note. Acceleration or deceleration are understood constant; motion of translation and rotary motion are understood rectilinear and circular respectively.
