Rossi for You

Innovation
Rossi offers a wide range of **solutions for an evolving industry**, flexible and innovative gearboxes and gearmotors for customer tailored solutions to maximize performance and minimize the total cost of ownership.

High quality, 3 years warranty
Our drive is to innovate and boost operations by manufacturing performing, precise, reliable and high-quality products all over the world. We are always one step forward in offering and developing solutions that can satisfy an unlimited number of application needs, even in the most demanding conditions.

Reliability
We are a reliable company with the right flexibility and know-how to respond to worldwide market requests, in all application fields, without leaving aside our commitment for the environment and value on human safety, to protect everyone's future.

Tools and processes
We continue to invest in new tools and processes, so our highly skilled specialist team in different fields are supporting you to find the best solution suitable for your demands, always by your side on every step of the project.

After-sale service
Highly trained mechanics and support teams can ensure a fast and efficient after-sale service providing support worldwide.

Digital support
Alongside our 24/7 **Rossi for You** support portal you have a suite of digital support tools enabling real time access to your order tracking, invoices, spare part tables download and contact to our service.

Experience
70 years

Shaped by more than 60 years of history Rossi meets your unique needs whether you need a standard design or a customized solution.

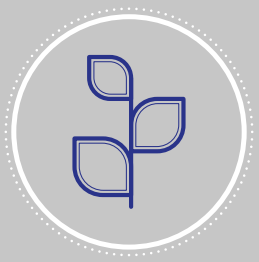
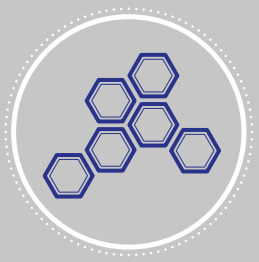
Maximum performance

We drive the heaviest applications worldwide



Sustainability

We care about environment



Modular system

For cost–effective and high quality solutions

Innovation

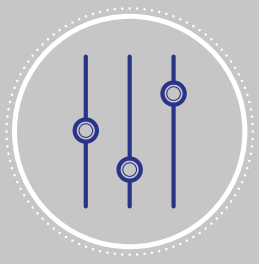
We are constantly thinking forward, solutions for an evolving industry

Digitalization

Rossi for You is always at your disposal for any info

Know-how

We support you through interdisciplinary know-how



Customization

Cost-effective solutions starting from standard products

Symbols and units of measure

All dimensions in the catalog are expressed in mm except where otherwise stated

Symbol	Description	Unit
f	frequency	Hz
F	force	lb
F_r, F_a	radial (overhung) loads, axial (thrust) loads	lb
fs	service factor	–
ft	thermal factor	–
G	weight (weight force)	lb
i	transmission ratio	–
i_N	nominal transmission ratio	–
L_h	total duration of load cycle	h
L_{WA}	sound power level	dB(A)
m	mass	lb
M_b	bending moment	lb in
n	angular speed	rpm
n_1	gear reducer input speed (high speed)	rpm
n_2	gear reducer output speed (low speed)	rpm
n_{2eq}	load cycle equivalent speed	rpm
n_{N2}	gear reducer nominal output speed	rpm
n_{2i}	gear reducer output speed during load cycle interval i	rpm
P	power	hp
P_1	gear reducer input power (high speed shaft), motor power	hp
P_2	gear reducer output power (low speed shaft)	hp
P_{N2}	gear reducer nominal output power (low speed shaft)	hp
Pt	thermal power	hp
Pt_N	gear reducer nominal thermal power	hp
P_{1th}	gear reducer equivalent thermal power	hp
T	torque	lb in

Symbol	Description	Unit
T_2	gear reducer output torque (low speed shaft), derived from input power and speed	lb in
T_{2eq}	load cycle equivalent torque	lb in
T_{N2}	gear reducer nominal output torque (low speed shaft)	lb in
T_{2i}	gear reducer output torque (low speed shaft), during load cycle interval i	lb in
T_S	screw tightening torque	N m
T_{start}	motor starting torque	lb in
T_{brake}	motor braking torque	lb in
$T_{ambient}$	ambient temperature	°F
T_{oil}	oil temperature	°F
t	time	s
ta	starting time	s
tb	braking time	s
U	voltage	V
W	work, energy	10^6 lb in
WK	moment of inertia	lb ft^2
WK_0^2	moment of inertia (of mass) of the motor	lb ft^2
WK_1^2	moment of inertia (of mass) of the gear reducer referred to high speed shaft	lb ft^2
WK_R^2	external (gear reducer, coupling, driven machine) moment of inertia (of mass) referred to to high speed shaft	lb ft^2
z	starting frequency	starts/h
z_0	no load starting frequency	starts/h
α	angular acceleration	rad/s^2
η	efficiency	–
φ	plane angle	rad
φa_1	revolution of motor shaft during acceleration	rad
φb_1	revolution of motor shaft during deceleration	rad
ω	agular velocity	rad/s

Additional indexes (subscripts) and other symbols

Index	Description
N	nominal
1	relating to high speed shaft (input)
2	relating to low speed shaft (input)
max	maximum
min	minimum
eq	equivalent

Index	Description
th	thermal
c	cycle
–	from ... to
≈	approximately equal to
≥	greater than or equal to
≤	less than or equal to

1 - General specifications

Universal «symmetrical» mounting: **suitable for horizontal or vertical mounting**

Rigid and precise cast iron single-piece housing; **high oil capacity**

Standard hollow low speed shaft, **prearranged for installation of backstop device**, **option of double extension high speed shaft**

Possibility of fitting particularly powerful motors and capability of withstanding high loads on the shaft end

Possibility of obtaining multiple drivers without restrictions on direction of rotation

Intermediate sizes 140, **180**, **225**, **280**, **360** – dimensions similar to previous sizes 125, 160, 200, 250, 320 – **conceived to be also a supporting series in particular applications; three size pairs**, standard and strengthened, **63** and **64**, **80** and **81**, **320** and **321**

Manufacturing and product management flexibility

High manufacturing quality standards

Minimum maintenance requirements

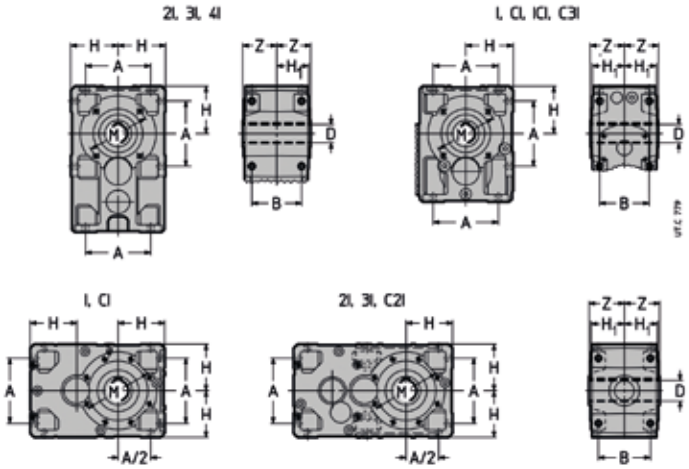
IEC motor

High, reliable and tested performance

Wide range of sizes, trains of gears and solutions.

"Long" series of helical gear reducers and gearmotors for applications with U position of motor/machine shaft and considerable distance between input and output shafts; same input and output coupling dimensions, same transmission ratios and performances, same combinations of motors and gear reducers as the standard series (**patent pending**).

This series of gear reducers and gearmotors combines and exalts the traditional qualities of helical and bevel helical gear reducers – **strength**, **accuracy**, and **reliability** – with advantages derived from modern design, manufacturing and operating criteria – **suitability for the heaviest duties**, **universality and ease of application**, **comprehensive size range**, **service**, **economy** – the advantages typically associated with high quality gear reducers produced in large series.



Fully interchangeable gear reducers – of the same size – independently from train of gears.

1.1 - Gear reducer

Main structural features

– **universal** mounting having feet integral with housing on 4 faces (3 faces for train of gears: I sizes 63 ... 100, CI sizes 40 ... 100, C3I, ICI) and B14 flange on 2 faces (1 face for standard model 2I, 3I and 4I sizes 40 ... 125); gear reducers and gearmotors 2I, 3I sizes 40 ... 125 and 4I sizes 63 ... 125 having reaction recess for shaft mounting arrangement (see ch. 6), B5 flange with spigot recess mountable on the faces with B14 flange (see ch. 17); the drawing and the strength of housing allow **interesting shaft mounting arrangements**, foot mounted motor coupling arrangement (see ch. 18) and attachments points for a variety of equipment;

– gear reducer overall dimensions are suitable to be equipped with large motor sizes transmitting **high nominal and maximum torques**, supporting **high loads on low and high speed shaft ends**;

– standard hollow low speed shaft in steel, with keyway and retaining ring grooves for extraction (excluding sizes 40 ... 63); standard (left or right hand extension) or double extension low speed shaft (see ch. 17).

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

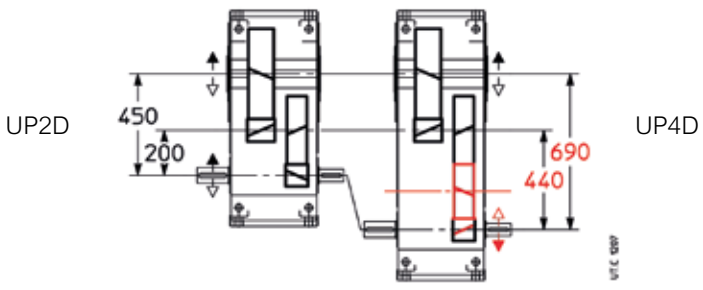
1 - General specifications

– gearmotors MR 4I (sizes 63 ... 125), MR C3I (sizes 50 ... 125) with **first reduction stage** including **2** coaxial cylindrical gear pairs in order to get high transmission ratio, with standardized motor, in an economic and compact way;
– improved and upgraded modular construction both for component parts and assembled product;
– standardized dimensions and compliance with standards;
– gear reducers: input face with machined surface (flange for R 3I 63 ... 125, R ICI) with fixing holes, high speed shaft end with key;
– gearmotors MR 3I 40 ... 125, MR 4I, MR ICI and MR C3I: first reduction pinion gear directly keyed onto the shaft end of **IEC standard motor**;
gearmotors MR 2I, MR 3I 140 ... 360, MR CI, MR C2I: **IEC standard motor** directly fitted into hollow high speed shaft; with **motor size** ⩾ **200**, to obtain easier installing and removal and avoid fretting corrosion, bevel helical gearmotors (CI, C2I) have a keying system with key and bronze bushing whereas helical gearmotors (2I, 3I) have a keying system with hollow high speed shaft with longitudinal cuts, shrink disc and key for a perfect alignment;
– possibility of **second high speed shaft extension** (or intermediate shaft extension for train of gears 3I 40 ... 125, 4I, ICI, C3I);
– taper roller bearings, excluding some shafts (high speed shaft) on which bearings are cylindrical roller or ball type;
– **cast iron** single-piece housing 200 UNI ISO 185 (**spheroidal** UNI ISO 1083 for sizes 140, 180, 225, 280, 360) with **stiffening ribs and high oil capacity**;
– oil bath lubrication; synthetic oil, providing lubrication «**for life**» and 1 plug (sizes 40 ... 64) or 2 plugs (sizes 80 and 81), **filled with oil** (sizes 40 ... 81); synthetic or mineral oil (ch. 18) with filler plug and valve, level and drain plug, supplied **without oil** (sizes 100 ... 360); sealed;
– additional bearings lubrication through proper pipelines or pump (sizes 100 ... 360);
– natural or forced cooling (fan – also in **flange** mounting – and/or coil, see ch. 17);
– **paint**: **external** coating in epoxy powder paint (sizes 40 ... 81) or water based dual compound polyurethane enamel (sizes 100 ... 360) resistant to atmospheric and aggressive agents (corrosivity category C3 ISO 12944-2); suitable for further coats only with dual-compound products after degreasing and sanding; color blue RAL 5010 DIN 1843, other colors and/or painting cycles on request see ch. 17); **internal** protection with epoxy powder paint (sizes 40 ... 81) suitable to resist to synthetic oils or with synthetic paint (sizes 100 ... 360) suitable to resist polyalphaolefines based synthetic or mineral oils.
– possibility to obtaining combined gear reducer and gearmotor units providing high transmission ratios;
– non-standard designs: backstop device (always pre-arranged, excluding size 40 and helical size 50), stepped hollow low speed shaft, supplementary cooling and lubrication systems, shaft mounting arrangements, special paints, Ⓔx **ATEX II 2 GD** and **3 GD**, design for agitators, etc. (ch. 17).
– **helical «long» model**: it is derived from the standard one (completing it) through the addition of an **idle gear** between wheel and pinion of the second-last reduction stage (first reduction stage for 2I train of gears) hence allowing to **distance considerably** the input and output shafts, whilst maintaining the same **specifications and performances** as the standard model. In particular:
– same **input and output coupling dimensions** (shafts and B14 output flange, motor sizes);
– same high speed shaft **bearing** (shafts and bearings) with the same transmission ratio;
– same **foot mounting dimensions** (A_1 dimension excluded);
– same **transmission ratios and performances**;
– same **combinations of motors and gear reducers**;
– same **thermal power** (thanks to the greater length of the housing);
– same **accessories** and non-standard **designs**;
– same **high quality level** (design solutions, production processes and tests, components, single-piece housing, modular and aesthetic design).

The «long» gear reducer obtained through this new design concept, makes possible also very low transmission ratios with proportioned and generous bearings in terms of high speed shaft roller bearings and shaft diameters.

Everything stated in this catalog is to be intended **valid both for standard and long model**, except otherwise stated.

Comparison between gear reducer R 2I 250 standard type UP2D and relevant long type **UP4D** (**patent pending**): highlighting the extension of center distance, the presence of the idle gear and the reversing of rotation direction.



Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Train of gears

– 1, 2, 3, 4 helical gear pairs (helical gear reducers);
– 2, 3 helical gear pairs and **1 idle gear** («long» model, helical gear reducers);
– 1 bevel gear pair plus 1, 2, 3 helical gear pairs (bevel helical gear reducers);
– 6 sizes with final reduction center distance to R 10 (40 ... 125, with 2 size pairs: standard and strengthened); 9 sizes with final reduction center distance to R 20 (140 ... 360, with 1 size pair: standard and strengthened), for a total of **18 sizes**;
– nominal transmission ratios to R 10 (i_N = 2.5 ... 160; i_N = 80 ... 400 for 4I) for helical gear units; to R 10 (i_N = 5 ... 200; i_N = 80 ... 500 for C3I) for bevel helical gear units; to R 20 (i_N = 9 ... 90), excluding I and ICI, for all sizes 140 ... 360;
– casehardened and hardened gear pairs in 16 CrNi4 or 20 MnCr5 steel (depending on size) and 18 NiCrMo5 according to UNI EN 10084;
– helical gear pairs with **ground** profile;
– GLEASON spiral bevel gear pairs with **ground** or accurately lapped profile;
– gear load capacity calculated for tooth breakage and pitting.

Specific standards

– nominal transmission ratios and principal dimensions according to UNI 2016 (DIN 323-74,NF X 01.001, BS 2045-65, ISO 3-73);
– toothing profile to UNI 6587-69 (DIN 867-86, NF E 23.011, BS 436.2-70, ISO 53-74);
– shaft heights to UNI 2946-68 (DIN 747-76, NF E 01.051, BS 5186-75, ISO 496-73);
– fixing flanges B14 and B5 (the latter with spigot «recess») taken from UNEL 13501-69 (DIN 42948-65, IEC 72.2);
– medium series fixing holes to UNI 1728-83 (DIN 69-71, NF E 27.040, BS 4186-67, ISO/R 273);
– helical shaft ends (long or short) to UNI ISO 775-88 (DIN 748, NF E 22.051, BS 4506-70, ISO/R775) with tapped butt-end hole to UNI 9321 (DIN 332 BI. 2-70, NF E 22.056) excluding correspondence d-D;
– parallel keys UNI 6604-69 (DIN 6885 BI. 1-68, NF E 27.656 and 22.175, BS 4235.1-72, ISO/R/773-69) except for specific cases of motor-to-gear reducer coupling where key height is reduced;
– mounting positions derived from CEI 2-14 (DIN EN 60034-7, IEC 34.7);
– load capacity verified according to UNI 8862, DIN 3990, AFNOR E 23-015, ISO 6336; thermal capacity verified.

Bevel helical gearmotor CI (also C2I) with high speed shaft for **90° multiple drives**.

Helical gearmotor with **backstop device** (always prearranged)

Bevel helical gearmotor ICI (also CI) with double extension low speed shaft and **high speed shaft extension** (design UO3D).

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

1.2 - Electric motor

Gearmotor dimensions and masses of present catalog (see ch. 12 and 14) refer to motor catalog TX.

Main structural features

– motor **standardized to IEC**;
– asynchronous three-phase, totally-enclosed, externally ventilated, with cage rotor;
– **IP 55** protection, **insulation class F**, temperature rise class **B**;
– rated power delivered on continuous duty S1 (excluding some cases of motor sizes with power not according to standard; see specific documentation) and referred to nominal voltage and frequency; maximum ambient temperature 104 °F (40 °C) and altitude 3 300 ft (1 000 m);
– capacity to withstand one or more overloads up to 1.6 times the nominal load for a maximum total period of 2 min per single hour;
– starting torque with direct on-line start at least 1,6 times the nominal one (it is usually higher);
– mounting position B5 and derivates as shown in the following table;
– **suitable for inverter duty** (generous electromagnetic sizing, low-loss electrical stamping, phase separators, etc.)
– designs available for every application need: flywheel, independent cooling fan, independent cooling fan and encoder, etc.

Brake motor constructive features

– particularly strong construction to withstand braking stresses; **maximum reduction of noise level**;
– spring-loaded d.c. electromagnetic brake; feeding from the terminal box; brake can also be independently fed directly from the line;
– braking torque proportioned to motor torque (usually $T_f \approx 2\ T_N$) and adjustable by adding or removing spring pairs;
– possibility of high frequency of starting;
– quick and rapid stop;
– hand lever for manual release with automatic return (on request for size ⩽ 160S); removable lever rod.

For other specifications and details see **specific documentation of cat. TX**.

Short time duty (S2) and intermittent periodic duty (S3); duty cycles S4 ... S10

In case of a duty-requirement type S2 ... S10 the motor power can be increased as per the following table; starting torque keeps unchanged.

Short time duty (S2). – Running at constant load for a given period of time less than that necessary to reach normal running temperature, followed by a rest period long enough for motor's return to ambient temperature.

Intermittent periodic duty (S3). – Succession of identical work cycles consisting of a period of running at constant load and a rest period. Current peaks on starting are not to be of an order that will influence motor heat to any significant extent.

$$\text{Cyclic duration factor} = \frac{N}{N+R} \cdot 100\%$$

where: N being running time at constant load,
R the rest period and N + R = 10 min (if longer consult us).

Duty			Motor size[1]		
			63 ... 90	**100 ... 132**	**160 ... 315**
S2	duration of running	90 min	1	1	1.06
		60 min	1	1.06	1.12
		30 min	1.25	1.18	1.25
		10 min	1.25	1.25	1.32
S3	cyclic duration factor	60%	1.12		
		40%	1.18		
		25%	1.25		
		15%	1.32		
S4 ... S10			consult us		

1) For motor sizes 90LC 4, 112MC 4, 132MC 4, consult us.

Frequency 60 Hz

Normal motors up to size 132 wound for 50 Hz can be fed at 60 Hz; in this case speed increases by 20%. If input-voltage corresponds to winding voltage, power remains unchanged, providing that higher temperature rise values are acceptable and that the power requirement is not unduly demanding, whilst starting and maximum torques decrease by 17%. If input-voltage is 20% higher than winding voltage, power increases by 20% whilst starting and maximum torques keep unchanged.

For brake motors, **see specific literature**.

From size 160 upwards motors – both standard and brake ones – should be wound for 60 Hz exploiting the 20% power increase as a matter of course.

Power available with high ambient temperature or high altitude

When motor has to run at an ambient temperature higher than 104 °F or at altitude above sea level higher than 3 300 ft, it has to be derated according to the following tables:

Ambient temperature [°F]	**86**	**104**	**113**	**122**	**131**	**140**
P/P_N [%]	106	100	96.5	93	90	86.5

Altitude a.s.l. [ft]	**3 300**	**4 900**	**6 600**	**8 200**	**9 800**	**11 500**	**13 100**
P/P_N [%]	100	96	92	88	84	80	76

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Electric motor specific standards

– nominal powers and dimensions to CENELEC HD 231 (IEC 72-1, CNR-CEI UNEL 13117-71 and 13118-71, DIN 42677, NF C 51- 120, BS 5000-10 and BS 4999-141) for mounting positions IM B5, IM B14 and derivatives;
– nominal performances and running specifications to CENELEC EN 60034-1 (IEC 34-1, CEI EN 60034-1, DIN VDE 0530-1, NF C51- 111, BS EN 60034-1);
– protection to CENELEC EN 60034-5 (IEC 34-5, CEI 2-16, DIN EN 60034-5, NF C51-115, BS 4999-105);
– mounting positions to CENELEC EN 60034-7 (IEC 34-7, CEI EN 60034-7, DIN IEC 34-7, NF C51-117, BS EN 60034-7);
– sound levels to CENELEC 60034-9 (IEC 34.9, DIN 57530 pt. 9);
– balancing and vibration velocity (vibration under standard rating N) to CENELEC HD 53.14 S1 (IEC 34-14, ISO 2373 CEI 2-23, BS 4999-142); motors are balanced with half key inserted into shaft extension;
– cooling to CENELEC EN 60034-6 (CEI 2-7, IEC 34-6): standard type IC 411; type IC 416 for non-standard design with axial independent cooling fan.

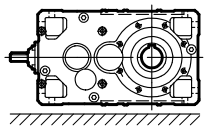
Gear reducer mounting position

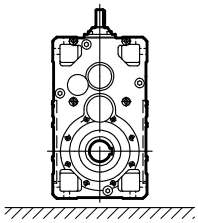
Gear reducer and gearmotor mounting positions are described in ch. **8**, **10**, **12**, **14** (the mounting position designation refers to foot mounting only, even if gear reducers are for universal mounting; e.g.: B14 flange fastening and derivatives; B5 flange fastening and derivatives, see ch. 17). Here following some designation examples of important mounting positions.

1. **Standard B3** mounting position; when having no particular needs, **prefer B3 mounting position** for its technical and economic cost effectiveness (maximum simplification of lubrication system, lower oil splash, lower gear reducer heating, stock availability).

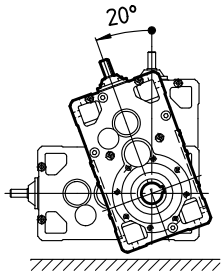


2. **Non-standard** mounting positions

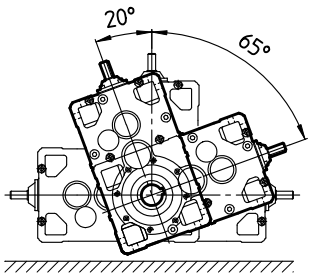
2a. Mounting position as per catalog (see ch. 8, 10, 12,14), **only one** and **fixed**, differing from B3; e.g.: mounting position **B6**



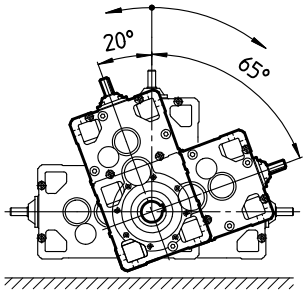
2b. **Inclined and fixed** mounting position; e.g.: mounting position **B6 - 20° B3**



2c. **One only** mounting position **but defined within a pre-determined angle**; e.g.: mounting position within **B6 - 20° B3 / B6 - 65° B8**



2d. **Oscillatory** mounting position (gear reducer oscillating when running); e.g.: mounting position B6 **- 20° B3 / B6 - 65° B8 oscillatory**



UT. C 2088

2 - Designation

Input speed

Complete the designation stating the input speed n_1, in the following cases:
– $n_1 > 1800$ rpm or $n_1 \leqslant 355$ rpm;
– for cases highlighted with following symbols (▲, ,) (ch. 7, 8, 9, 10, 12, 14);
– when forced cooling is required.

Example:
R I 125 UP2A-2.53 **mounting position V6**, n_1= **900** rpm
R CI 360 UO2V-16 n_1= **2000** – **600** rpm

Motor

When the gearmotor is supplied **equipped with a standard Rossi motor**, fill in the designation stating the motor designation (ref. cat. TX).
Examples:
MR ICI 200 UO3A - 42 × 350 - 50.3
HB3 160M 4 400-50 B5

MR ICI 200 UO3A - 42 × 350 - 50.3
HBZ 160L 4 400-50 B5

When the gearmotor is supplied **without motor**, omit the designation and add «without motor».
Example:
MR 2I 140 UP2A - 48 × 350 - 17.6 **without motor**

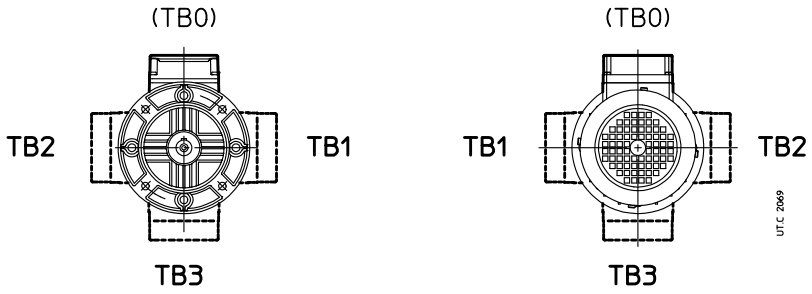
When motor is supplied by the **Buyer**[1], complete the designation by stating the description of «motor supplied by us».

1) The motor supplied by the Buyer must be to IEC with mating surfaces machined under accuracy rating IEC 60072-1 and is to be sent carriage and expenses paid to our factory for fitting to the gear reducer.

Example:
MR 2I 140 UP2A - 48 × 350 - 17.6
motor supplied by us

Motor terminal box position

Complete the designation stating the motor terminal box position if differing from the standard one (TB0; see ch.12, 14 and scheme below).
The cable input is Buyer's responsibility.
Example:
MR ICI 200 UO3A - 42 × 350 / 50.3
HB3 160M 4 400-50 B5 **TB3**



View from drive end (D)

View from non-drive end (N)

Accessories and non-standard designs

In the event of a gear reducer or gearmotor being required in a design different from those stated above, specify it in detail (ch. 17).

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

3 – Service factor *fs*

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

3 - Service factor *fs*

Service factor ***fs*** takes into account the different running conditions (nature of load, running time, frequency of starting, speed n_2, other considerations) which must be referred to when performing calculations of gear reducer selection and verification.

The powers and torques shown in the catalog are nominal (i.e. valid for ***fs*** = 1) for gear reducers, corresponding to the ***fs*** indicated for gearmotors.

The **minimum service factor required** is given by:

$$\textbf{fs required} \geqslant \textbf{fs}_1 \cdot \textbf{fs}_2 \cdot \textbf{fs}_3 \cdot \textbf{fs}_4 \cdot \textbf{fs}_5$$

or, in case of selection according to $n_2 \cdot L_h$:

$$\textbf{fs required} \geqslant \textbf{fs}_1(8\ \text{h/d}) \cdot \textbf{fs}_2 \cdot \textbf{fs}_3 \cdot \textbf{fs}_4$$

Service factor $\textbf{fs}_1$ according to **nature of load** and to **running time**

Details and considerations about service factor.

Nature of load of driven machine[1]		fs_1[2] Running time [h/d] ⩽				
Ref.	Description	**2**	**4**	**8**	**16**	**24**
a	**Uniform**	0.8[3]	0.9[3]	1	1.18	1.32
b	**Moderate overloads** (1.6 x normal)	1	1.12	1.25	1.5	1.7
c	**Heavy overloads** (2.5 x normal)	1.32	1.5	1.7	2	2.24

Service factor $\textbf{fs}_2$ based on **nature of load** and of **frequency of starting**

Nature of load of driven machine[1]		fs_2 Frequency of starting ***z*** [starts/h]							
Ref.	Description	**2**	**4**	**8**	**16**	**32**	**64**	**125**	**250**
a	**Uniform**	1	1.06	1.12	1.18	1.25	1.32	1.4	1.5
b	**Moderate overloads** (1,6 x normal)	1	1	1.06	1.12	1.18	1.25	1.32	1.4
c	**Heavy overloads** (2,5 x normal)	1	1	1	1.06	1.12	1.18	1.25	1.32

Service factor $\textbf{fs}_3$ based on **motor type**

Motor type		fs_3
Description		
Electric three-phase	$P_1 \leqslant 9.2$ kW	1
	$P_1 > 9.2$ kW[4]	1.06[4]
Brake electric three-phase		1.06
Internal combustion	multi-cylinder	1.25
	single-cylinder	1.5

Service factor $\textbf{fs}_4$ based on **reliability level**

Reliability level[5]	fs_4
normal	1
medium	1.25
high	1.4

Service factor $\textbf{fs}_5$ based on **output angular speed** n_2

Output speed n_2 [min^{-1}]	fs_5
560 ÷ 355	1.25
355 ÷ 224	1.18
224 ÷ 140	1.12
140 ÷ 90	1.06
< 90	1

fs values stated above are valid for:

– maximum time on overload 15 s, on starting 3 s; if over and/or subject to heavy shock effect, consult us;

– a whole number of overload cycles (or start) **imprecisely** completed in 1, 2, 3 or 4 revolutions of low speed shaft; if **precisely** a continuous overload should be assumed;

Motors having a starting torque not exceeding nominal values (star-delta starting, particular types of motor operating on direct current, and single-phase motors), and particular types of coupling between gear reducer and motor, and gear reducer and driven machine (flexible, centrifugal, fluid and safety couplings, clutches and belt drives) affect service factor favourably, allowing its reduction in certain heavy-duty applications; consult us if need be.

1) For indication on the type of load of the driven machine according to the application, see table on next page.

2) When selecting with $n_2 \cdot L_h$. use exclusively the column 8 h/d.

3) Verify that the torque T_2 is lower than or equal to T_{N2} valid for $n_1 \leqslant 90$ rpm (see pages 107 and 195); when having variable load verify each load cycle interval (see ch. 5.2).

4) For Y-Δ starts, running with inverter or «soft start» devices, fs_3=1.

5) Reliability degrees higher than normal are required in presence of: very difficult maintenance, great importance of gear reducer in the production cycle, safety, etc.

3 - Service factor *fs*

Classification of nature of load according to application

Application	Ref. load *
Stirrers and mixers	
Liquids:	
– constant density	a
– varying density, solids in suspension, high viscosity	b
concrete mixers, mullers, flash mixers	c
Feeders and batchers	
rotary (roller, table, sector)	a
belt, screw, plate	a, b
reciprocating, shaker	c
Compressors	
centrifugal (single-stage, multi-stage)	a
rotary (vane, lobe, screw)	b
axial	b
reciprocating:	
– multi-cylinder	b
– single-cylinder	c
Elevators	
belt, centrifugal or gravity discharge, screw jacks, escalators	a, b
bucket, arm and tray elevators, paddle wheel, hoists, skips	b
man lifts, mobile scaffolding, passenger transport (cable cars, chair, ski, gondola lifts etc.)	a, b
Excavators and dredges	
cable reels, conveyors, pumps, winches (manoeuvring and utility), stackers, draining wheels	b
cutter head drives, cutters, excavators (bucket ladder, paddle wheel, cutter)	c
vehicles:	
– on rails	b
– crawlers	c
Crushers and granulators	
sugar cane, rubber, plastics	b
minerals, stone	c
Cranes, winches and travelling lifts	
travel (bridge, trolley, forks)[1]	b
slewing	b
hoist[2]	a, b
Food industry	
cookers (cereals and malt), mash tubs	a
slicers, dough mixers, meat grinders, beet slicers, centrifuges, peelers, winemaking plant, bottle/bin/cratewashers, rinsers, fillers, corkers, cappers, extruders, crate filling and emptying equipment	b
Paper mills	
winders, suction rolls, dryers, embossing machinery, bleachers, press rolls, coating rolls, paper rolls, beaters, and pulpers	a
agitators, mixers, extruders, chip feeders, calenders, felt dryers and stretchers, rag grinders, washers, thickeners	b
cutters, chippers, calenders (super), felt whippers, glazing machines, presses	c
Lumber and woodworking industries	
mechanical loaders, pallet stackers	a, b
conveyors for:	
– boards, chips, waste	b
– logs	c
machine tools (planing, cutting, cross-cut and re-sawing, tenoning, bevelling, moulding, sanding, sizing and scratch-brushing machinery etc.):	
– feed drive	b
– cutter drive	b, c
barkers:	
– mechanical and hydraulic	b
– drum	c
Oil industry	
paraffin filter presses, chillers	b
rotary drilling equipment	c
pumping equipment	
Textile industry	
calenders, cards, pickers, dryers, nappers, spinners, slashers, pads, soapers, washers, mangles, tenter frames, looms (Jacquard), warping machines, winders, knitting machines, dyeing machines, twisting frames, gig mills, cutters	b
Clay working machinery	
pug mills, extruders, rotary deslimers	b
brick and tile presses	c
Rubber and plastics industries	
extruders:	
– plastics	b
– rubber	c
mixing mills, warming mills, friction calenders, refiners, tubers and strainers, rolling mills	b
crackers, masticators	c
Wrapping and stacking machinery	
wrapping (film, cardboard), binding, strapping and labelling equipment	a
palletizing/depalletizing and stacking/unstacking machinery, palletizing robots	b
Engineering machine tools	
boring, shaping, planing, broaching, gear cutting and FMS machines, etc.:	
– main drivers (cut and feed) auxiliary drives (tools magazine, chip conveyor, workpiece infeed)	a
Mechanisms	
indexing, crank and slotted link, Maltese cross, articulated parallelogram	b
rod and crank, cam control (cam and tappet, cam and rocker)	c
Metal mills	
shears:	
– trimming, cropping, facing	b
– for sheet/plate, ingots, billets	c
transverse drive rollers, draw benches, coilers, inverter, draglines, flattening rolls, bending rolls	b
pushers, descaling equipment, pipe welders, mill roll train drives, rolling mills, forging presses, billet croppers, power hammers, punches, impact extruders, tapping machines, straightening presses	c
Rollerways	b, c
Mills	
rotary (rod, roller, pebble, ball)	b
hammer, pin crusher, centrifugal, impact, rolling (ball or roller)	c
Pumps	
rotary (gear, screw, lobe, vane) and axial	a, b
centrifugal:	a
– liquids, constant density	
– liquids, variable density or high viscosity	b
proportioning	b
alternative:	
– single acting (⩾ 3 cylinders), double acting (⩾ 2 cylinders)	b
– single acting (⩽ 2 cylinders), double acting single cylinder	c
Rotating drums	
dryers, chillers, rotary kilns, washing machines	b
tumblers, cement kilns	c
Transport conveyors	
belts (plastic, rubber, metal) for:	
– fine grade loose material	a
– coarse grade loose material or discrete items	b
belt, apron, bucket, slat, tray, roller, screw, chain, overhead rail, assembly	b
drag (slat, flight, chain, Redler, etc.)	b
ground level chain, flow accumulating	c
reciprocating, shaker	
overhead power rail	
Sewage treatment	
biological tanks (revolving disk)	a
dewatering screws, collectors, rotary screens, thickeners, vacuum filters, anaerobic digestion tanks	b
aerators, rotary breakers	c
Screen and riddles	
air washing, travelling water intake	a
rotary (stone, gravel, cereals)	b
vibrating screens, riddles, jigs	c
Fans	
small diameter (centrifugal, axial-flow)	a
large diameter (mines, furnaces, etc.) cooling towers (inducted or forced draft), ducted, piston	b

* Nature of load reference admits of modification where precise knowledge of duty is available.
1) In the traverse movement of the bridge usually it is necessary to have at least fs > 1,6 and in the storeyard cranes fs > 2 (container handling).
2) For selection of fs to F.E.M./I-10.1987, consult us.

4 – Thermal power *Pt* [hp]

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

4 - Thermal power *P*t [hp]

Nominal thermal power Pt_N, written in red in the table, is that which can be applied at the gear reducer input, also for long model, without exceeding 203 °F[1] (95 °C) approximately oil temperature when operating in following running conditions:
– input speed n_1 = 1 800 rpm;
– mounting position B3;
– continuous duty S1;
– maximum ambient temperature 68 °F (20 °C) (in the table, values referred to 104 °F (40 °C) are stated as well);
– maximum altitude 3 300 ft above sea level;
– air speed ⩾ 4 ft/s (Value typical in presence of an gearmotor with self cooled motor).

Always verify that power applied P_1 is lower than or equal to gear reducer nominal thermal power Pt_N multiplied by the corrective coefficients ft_1, ft_2, ft_3, ft_4, ft_5 (stated in the following tables) considering the several operational conditions:

$$P_1 \leqslant Pt_N \cdot ft_1 \cdot ft_2 \cdot ft_3 \cdot ft_4 \cdot ft_5$$

When the power applied is not constant and when the exact load cycle is given, it is possible, or advisable, to calculate the equivalent power applied, according to the formula:

$$P_{1th} = \frac{1}{\eta} \cdot \sqrt[3]{\frac{P^3_{2_1} \cdot t_1 + P^3_{2_2} \cdot t_2 + \ldots + P^3_{2_i} \cdot t_i + \ldots + P^3_{2_n} \cdot t_n}{t_c}}$$

where:
η is the efficiency of gear reducer (see ch. 6);
P_{2i} [kW] is the power, referred to the gear reducer output, required in the time interval t_i [s];
$t_c = t_1 + t_2 + \ldots + t_i + \ldots + t_n$ is the total duration of load cycle [s].

In these cases choose factor ft_2 from the continuous duty column S1.

Whenever the thermal verification should not be satisfied, in spite the prearrangement of cooling system, it is possible to install an **independent cooling unit with heat exchanger** (see ch. 17); consult us.

Thermal power needs not be taken into account when maximum duration of continuous running time is 1 ÷ 3 h (from small to large gear reducer sizes) followed by rest periods long enough to restore the gear reducer to near ambient temperature (likewise 1 ÷ 3 h).

In case of maximum ambient temperature above122 °F (50 °C) or below 32 °F (0 °C) consult us.

Thermal factor ft_1 (= $ft_{1a} \cdot ft_{1b}$) according to **cooling system** and **input speed** n_1

Cooling system				ft_{1a}, ft_{1b} input speed n_1 [rpm] ⩾				
				710	**900**	**1 120**	**1 400**	**1 800**
ft_{1a}	Natural convection	train of gears	I	2	1.8	1.6	1.4	1
			2I, CI	1.4	1.32	1.25	1.18	1
			3I, 4I, ICI, C2I, C3I	1.12	1.12	1.09	1.06	1
ft_{1b}	Fan cooling[3) 4) 6)]	with 1 radial fan (helical gear unit)		1.12	1.18	1.25	1.32	1.4
		with 2 radial fans (helical gear unit) with 1 radial fan (bevel helical gear unit)		1.25	1.4	1.6	1.8[5)]	2
	With water coil[4)]			2				
	With internal exchanger[4)]			see ch. 17				

1) Corresponding to a mean temperature of the housing external surface approx. equal to 185 °F (85°C) (locally this temperature may also reach the oil one).
2) For bevel helical gear reducers and gearmotors with double extension high speed shaft multiply Pt_N by **0,85**.
3) With simultaneous water cooling by coil, values are multiplied by 1,8.
4) Refer to ch. 17 about positions, overall dimensions and design verification.
5) Value valid also for proper electric fan (installation by Customer).
6) Values for 3-phase motors 4-pole to be multiplied by 1,12. Consult us.

5.1 - Preliminary considerations

Motor power

Taking into account the efficiency of the gear reducer, and other drives – if any – motor power is to be as near as possible to the power rating required by the driven machine: accurate calculation is therefore recommended.

The power required by the machine can be calculated, seeing that it is related directly to the power-requirement of the work to be carried out, to friction (starting, sliding of rolling friction) and inertia (particularly when mass and/or acceleration or deceleration are considerable). It can also be determined experimentally on the basis of tests, comparisons with existing applications, or readings taken with amperometers or wattmeters.

An oversized motor would involve: a greater starting current and consequently larger fuses and heavier cable; a higher running cost as power factor (cos φ) and efficiency would suffer; greater stress on the drive, causing danger of mechanical failure, drive being normally proportionate to the power rating required by the machine, not to motor power.

In such cases, a detailed description of duty requirement must be made available: duration and frequency per hour of work cycle, acceleration and deceleration requirements if any, inertia, loads deriving from friction and work. In the absence of such data it is essential to provide all details which will permit their determination.

Only high values of ambient temperature, altitude, frequency of starting or other particular conditions require an increase in motor power.

Input speed n_1

For gear reducers, the maximum input speed, valid for **continuous duty S1**, is the one stated in the following table, according to train of gears and to gear reducer size; however, depending on the specific transmission ratio this limit may not be reacheable: for these cases, in the selection tables (see ch. 7, 9), the norminal power P_{N2} isn't stated and the given T_{N2} value is valid for the selection method type B (see ch. 5.2) only.

For intermittent duty or for particular needs, higher speeds may be possible, but always lower than values of n_{1peak}: consult us.

Peak speed is admitted for a maximum duration of 5s, including a proper rest period or a low speed period for the cooling of gear reducer, especially on high speed shaft side.

For variable n_1, the selection should be carried out on the basis of n_{1max}, but it should also be verified on the basis of n_{1min}.

When there is a belt drive between motor and gear reducer, different input speeds n_1 should be examined in order to select the most suitable unit from engineering and economy standpoints alike (our catalog favours this method of selection as it shows a number of input speed values n_1 relating to a determined output speed n_{N2} in the same section).

Input speed should not be higher than 1 800 rpm, unless conditions make it necessary; better to take advantage of the transmission, and use an input speed lower than 900 rpm.

5.2 - Gear reducer

For the determination of gear reducer size it is possible to procede in two different ways:

A) considering **the daily running time** (**h/d**);

B) considering the **total running duration** request L_h

Method A) is easier but more generic and requires a good knowledge of the applications; on the contrary, method B) is more accurate, but more complex.

Attention: Concerning above mentioned points, the gear reducer nominal performance calculated in the two different ways could slightly differ; in these cases, however, method B), as it is more precise, will be considered valid.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Method A - Determining the gear reducer size considering the daily running time (h/d)

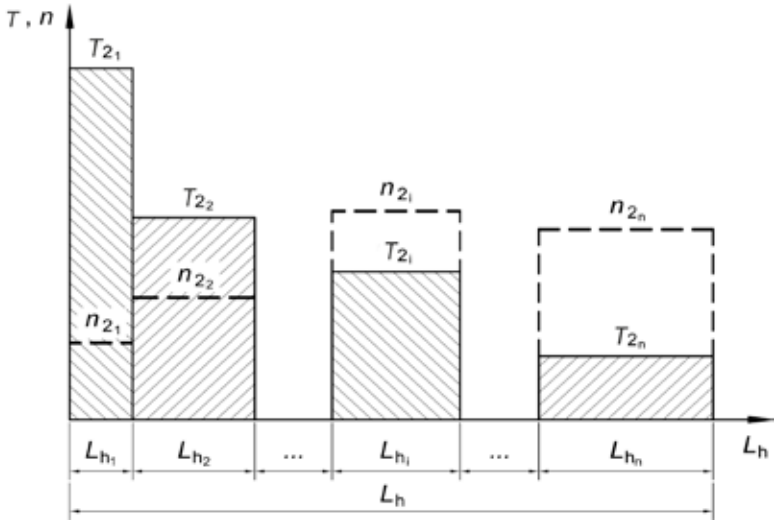
– Fill in the selection questionnaire in all its parts at page 36; in particular, make available the power P_2 required at gear reducer output, the angular speeds n_2 and n_1, the running conditions (nature of load, daily running time **h/d**, frequency of starting ***z***, other considerations) referring to ch. 3.
– Determine service factor ***f***s on the basis of running conditions (ch. 3).
– Select the gear reducer size (also, the train of gears and transmission ratio *i* at the same time) on the basis of n_2, n_1 and of a power P_{N2} greater than or equal to $P_2 \cdot f$s (ch. 7 and 9).
– Calculate power P_1 required at input side of gear reducer using the formula P_2 / η where η = 0,98 – 0,92 is the efficiency of the gear reducer (ch. 6).

When for reasons of motor standardization, power P_1 applied at input side of gear reducer turns out to be higher than the power required (considering motor/gear reducer efficiency), it must be certain that this excess power applied will never be required, and frequency of starting ***z*** is so low as not to affect service factor (ch. 3).
Otherwise, make the selection by multiplying P_{N2} by P_1 applied / P_1 required.
Calculations can also be made on the basis of torque instead of power; this method is even preferable for low n_2 values.

Method B - Determining the gear reducer size considering the total running duration L_h

– Fill in the selection questionnaire in all its parts at page 36; in particular, make available the torque T_2, the angular speed n_2 required at gear reducer output, the running conditions (nature of load, **total running duration** foreseen L_h, frequency of starting ***z***, other considerations) referring to ch. 3.
– In presence of required torque M_2 and angular speed n_2 **variable in time**, according to a given load cycle, calculate the equivalent torque T_{2eq} and the equivalent angular speed n_{2eq} with the following formulae:

T_{2i}	[lb in] is the torque required (constant) in the interval *i*
n_{2i}	[rpm] is the output shaft speed (constant) during interval *i*
t_i	[s] is the duration of interval *i*
n_{2eq}	[rpm] is the equivalent speed in the cycle



$$T_{2eq} = \sqrt[p]{\frac{T_{2_1}^p \cdot n_{2_1} \cdot L_{h_1} + T_{2_2}^p \cdot n_{2_2} \cdot L_{h_2} + \ldots + T_{2_i}^p \cdot n_{2_i} \cdot L_{h_i} + \ldots + T_{2_n}^p \cdot n_{2_n} \cdot L_{h_n}}{n_{2_{eq}} \cdot L_h}}$$

$$n_{2eq} = \frac{n_{2_1} \cdot L_{h_1} + n_{2_2} \cdot L_{h_2} + \ldots + n_{2_i} \cdot L_{h_i} + \ldots + n_{2_n} \cdot L_{h_n}}{L_h}$$

where:

T_{2eq}	[lb in] is the load cycle equivalent torque
T_{2_i}	[lb in] is the required torque (constant) on the low speed shaft during interval *i*
n_{2eq}	[rpm] is the load cycle equivalent speed
n_{2_i}	[rpm] is the speed (constant) of the low speed shaft in the interval *i*
Lhi	[h] is the duration of interval *i*
Lh	[h] Lh1 + ... + Lhi + ...+ Lhn is the total duration of load cycle
p =	3,33 if $n_{2eq} \cdot L$h . value stated in the following table according to the train of gears
p =	6,61 if $n_{2eq} \cdot L$h < value stated in the following table according to the train of gears

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

$n_{2eq} \cdot L_h$ [rpm · h]					
R I	**R 2I**	**R 3I**	**R CI**	**R ICI**	**R C2I**
2 000 000	2 800 000	4 000 000	1 400 000	2 000 000	710 000

– Select the gear reducer size (also, the train of gears and trasmission ratio i at the same time) on the basis of $n_{N2} \cdot L_h$, i_N close to the values previously calculated and on the basis of a torque T_{N2} greater than or equal to $T_2 \cdot fs$ required (or $T_{2eq} \cdot fs$ required), see ch. 7 and 9.
– Calculate power P_1 required at input side of gear reducer using the formula P_2 / η where η = 0.98 – 0.92 is the efficiency of the gear reducer (ch. 6).

When for reasons of motor standardization, power P_1 applied at input side of gear reducer turns out to be higher than the power required (considering motor/gear reducer efficiency), it must be certain that this excess power applied will never be required, and frequency of starting z is so low as not to affect service factor (ch. 3).

Otherwise, make the selection by multiplying P_{N2} by P_1 applied P_1 required.

Attention. The values of P_{N2} highlighted in the selection tables with grey background are valid only for the value of n_{N2} specified and therefore they are to be ignored for whatever value of $n_2 \cdot L_h$.

Verifications

– Verify possible radial loads F_{r1}, F_{r2} and axial load F_{a2} by referring to instructions and values given in ch. 16.
– When a load chart is available, and/or there are overloads – due to starting on full load (especially with high inertias and low transmission ratios), braking, shocks, gear reducers in which the low speed shaft becomes driving member due to driven machine inertia, or other static or dynamic causes - verify that the maximum torque peak (ch. 6) is always less than **1.6 · T_{N2}**; if it is higher or cannot be evaluated in the above cases, install a safety device so that **1.6 · T_{N2} will never be exceeded**.
– Verify, when fs < 1, that torque T_2 is less than or equal to T_{N2} value valid for $n_1 \leqslant$ 90 rpm (see pages 107 and 195),
– Verify that input speed is lower than or equal to n_{1max} (see ch. 5.1);
– Verify **for each single interval i** of the eventual load cycle that the torque required T_{2i} is lower than **1.6** · T_{N2} and anyway never higher than T_{N2} valid for $n_1 \leqslant$ 90 rpm (see page 107 and 195) and that the input speed (relevant to the low speed shaft speed n_{2i}) is $n_{1i} \leqslant n_{1max}$ (see ch. 5.1);
– Verify, usually for sizes ⩾ 100, possible need for forced cooling (ch. 4 and 17).
– For gear reducers sizes 140, 180, 225, 280, 321, 360 with backstop device having particular i_N or low fs values, verify load capacity of backstop device according to the values given in the table «Backstop device load capacity» (ch. 17).

5.3 - Gearmotor

Determining the gearmotors size

– Fill in the selection questionnaire in all its parts at page 36; in particular, make available the necessary data: power P_2 required at gearmotor output, angular speed n_2, running conditions (nature of load, duration, frequency of starting z, other considerations), referring to ch. 3.
– Determine service factor fs on the basis of running conditions (ch. 3).
– Select the gearmotor size on the basis of n_2, fs and of a power P_1 greater than or equal P_2 (ch. 11, 13). If power P_2 required is the result of a precise calculation, the gearmotor should be selected on the basis of a power P_1 equal to or greater than P_2 / η, where η = 0.96 – 0.92 is gear reducer efficiency (ch. 6). The torque value T_2 stated in the tables (ch. 11, 13) has been calculated taking into account efficiency.

When for reasons of motor standardization, power P_1 available in catalog is much greater than the power P_2 required, the gearmotor can be selected on the basis of a lower service factor ($fs \cdot P_2 / P_1$) provided it is certain that this excess power available will never be required and frequency of starting z is low enough not to affect service factor (ch. 3).

Calculations can also be made on the basis of torque instead of power; this method is even preferable for low n_2 values.

Verifications

– Verify possible radial load F_{r2} and axial load F_{a2} referring to directions and values given in ch. 16.
– For the motor, verify frequency of starting z when higher than that normally permissible, referring to directions and values given in ch. 1.2; this will normally be required for brake motors only.
– Verify, in case of **motors supplied by the customer**, that the **static bending moment T_b** generated by motor weight on the counter flange of gear reducer is lower than the value allowed T_{bmax}, stated in the ch. 6.
Loads higher than permissible loads may be present in dynamical applications where the gearmotor is subjected to translations, rotations or oscillations: consult us for the study of every specific case
– When a load chart is available, and/or there are overloads – due to starting on full load (especially with high inertias and low transmission ratios), braking, shocks, gear reducers in which the low speed shaft becomes driving member due to driven machine inertia, or other static or dynamic causes - verify that the maximum torque peak (ch. 6 is always less than 1,6 · T_{N2} ($T_{N2} = T_2 \cdot fs$, see ch. 11 and 13); if it is higher or cannot be evaluated in the above cases, install a safety device so that **1.6 · T_{N2} will never be exceeded**.
– Verify, usually for P_1 ⩾ 40 hp, possible need for forced cooling (ch. 4 and 17).

5.4 - Selection questionnaire

For the collection of data and of all information necessary for a correct selection of gear reducer or gearmotor, fill in the questionnaire at the following page.

Attach technical specifications, if any, concerning the gear reducer or the gearmotor excluding other parts of the machine or of the plant.

When it is possible, attach the questionnaire with drawings, pictures and any further information useful to facilitate the best selection from a technical and economic point of view.

1) To ISO/CD 8579.
2) Mean value of measurement at 1 m from external profile of gear reducer standing in free field on a reflecting surface.
3) For n_1 710 – 1 400 rpm, modify tabulated values: thus n_1 = 710 rpm, -5 dB(A); n_1 = 900 rpm, -4 dB(A); n_1 = 1 120 min^{-1}, -3 dB(A); n_1 = 1 400 rpm, -2 dB(A).
4) For sizes R I 225, 280 and 360, increase values of 1 dB(A).

In case of gearmotor (motor supplied by Rossi) add 1 dB(A) to the values in the table for 4 poles 60 Hz motors.
If required, gear reducers can be supplied with reduced sound levels (normally 3 dB(A) less than tabulated values): consult us.
In case of gear reducers with fan cooling, add to the values in the table 3 dB(A) for 1 fan and 5 dB(A) for 2 fans.

Gear ratio of input helical train of gears

The partial transmission ratio of input helical train of gears is given in the table; this ratio may be useful when calculating the speed of the intermediate shaft extension for **... D** design (see ch. 8, 10, 12, 14).

Gear reducer size	Gear ratio		Gear ratio of input helical train of gears – Gearmotors Motor size

1) Values valid for trains of gears: **3I** with $i_N \geq 100$, **ICI** with $i_N \geq 100$, **4I** with $i_N \geq 315$, **C3I** with i_N = 400.
2) Values valid for trains of gears: **3I** with i_N = 80, **ICI** with $i_N \geq 80$.
3) Values valid for train of gears: **ICI** with $i_N \geq 63$.

Efficiency

The efficiency stated in the table is indicative and referred to nominal running conditions (torque, speed, temperature); it is necessary to keep in mind that the efficiency value can diminish considerably for values of $T_2 \ll T_{N2}$

Model	Nominal efficiency η

Overloads

When a gear reducer is subjected to high static and dynamic overloads, the need arises for verifying that such overloads will always remain lower than **1.6 · T_{N2}** (see ch. 7, 9; see ch. 11, 13 where $T_{N2} = T_2 \cdot fs$).

Overloads are normally generated when one has:

– starting on full load (especially for high inertias and low transmission ratios), braking, shocks;

– gear reducers in which the low speed shaft becomes driving member due to driven machine inertia;

– applied power higher than that required; other static or dynamic causes.

The following general observations on overloads are accompanied by some formulae for carrying out evaluations in certain typical instances.

Where no evaluation is possible, install safety devices which will keep values within **1.6 · T_{N2}**.

Starting torque

When starting on full load (especially for high inertias and low transmission ratios) verify that **1.6 · T_{N2}** is equal to or greater than starting torque, by using the following formula:

$$T_2 \text{ start} = \left(\frac{T \text{ start}}{T_N} \cdot T_2 \text{ available} - T_2 \text{ required}\right) \frac{WK_R^2}{WK_R^2 + WK_0^2} + T_2 \text{ required}$$

where:

T_2 required is the torque absorbed by the machine through work and frictions;

T_2 available is the output torque due to motor nominal power;

WK_0^2 is the moment of inertia (of mass) of the motor;

WK_R^2 is the external moment of inertia (of mass) in kg m^2 (gear reducers, couplings, driven machine) referred to the motor shaft;

NOTE: when seeking to verify that starting torque is sufficiently high for starting, take into account starting friction, if any, in evaluating T_2 required.

Stopping machines with high kinetic energy (**high moments of inertia combined with high speeds**) **with brake motor**

Verify braking stress by means of the formula:

$$\left(\frac{Tf}{\eta} \cdot i + T_2 \text{ required}\right) \frac{WK_R^2}{WK_R^2 + WK_0^2} - T_2 \text{ required} < 1.6 \cdot T_{N2}$$

where:

Tf is the braking torque setting (see table in ch. 1.2); for other symbols see above and ch. 1.

Operation with brake motor

Starting time *t*a and revolutions of motor φa_1

$$ta = \frac{(WK_0^2 + WK_R^2) \cdot n_1}{25.603 \left(T \text{ start} - \frac{T_2 \text{ required}}{i}\right)} \text{ [s]}; \qquad \varphi a_1 = \frac{ta \cdot n_1}{19.1} \text{ [rad]}$$

Braking time *t*f and revolutions of motor φf_1

$$tf = \frac{(WK_0^2 + WK_R^2) \cdot n_1}{25.603 \left(Tf + \frac{T_2 \text{ richiesto}}{i}\right)} \text{ [s]}; \qquad \varphi f_1 = \frac{tf \cdot n_1}{19.1} \text{ [rad]}$$

where:

T start [lb in] is motor starting torque $\left(\frac{63030 \cdot P_1}{n_1} \cdot \frac{T \text{ start}}{M_N}\right)$ (see ch. 1.2);

Tf [lb in] is the braking torque setting of the motor (see ch. 1.2);

for other symbols see above and ch. 1.

Assuming a regular air-gap and ambient humidity, and utilizing suitable electrical equipment, repetition of the braking action, as affected by variation in temperature of the brake and by the state of wear of friction surface, is approx ± 0.1 · φf_1.

Friction surface life

As a rough guide (see specific literature), the number of braking permissible between successive adjustments of the air-gap is given by the formula $\frac{W \cdot 10^5}{Tf \cdot \varphi b_1}$

where:

W [10^6 · lb in] is the work of friction between successive adjustments of the airgap as indicated in the table; for other symbols see above.

The air-gap should measure between min 0.25 and max 0.6; as a rough guide, 5 adjustments can be made.

Angular backlash and torsional stiffness

A rough guide for the angular backlash (high speed shaft being locked) is given in the table. It varies according to temperature and transmission ratio.

Also the **approx.** values for low speed shaft torsional stiffness – high speed shaft being locked – are given in the table according to the train of gears.

The values stated in the table, since necessarily estimated, are to be considered valid for long model too. On request, gear reducers with **reduced backlash** lower than or equal to the minimum table values are available.

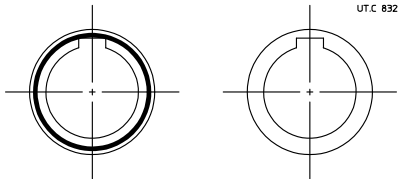
6 - Structural and operational details

Reference groove

The reference for identification of the hollow low speed shaft side opposite to which it is advisable to apply the radial load, is provided by a groove as shown in the drawing below. The position of the reference groove is identified by the symbol ● in the drawings «Design» of ch. 8, 10, 12 and 14.



groove side ● opposite side to groove

Plug dimensions

Gear reducer size	40, 50	63 ... 81	100 ... 140	160 ... 280	320 ... 360
Size threaded holes	G 1/4"	M16 × 1,5	G 1/2"	G 3/4"	G 1"
Tightening torque lb in	62	124	124	124	220

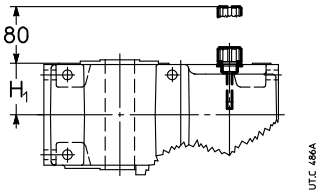
Filler and level plugs

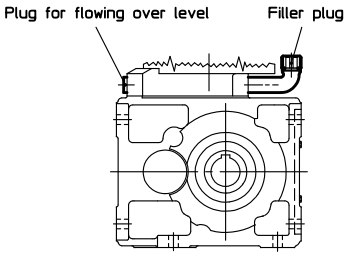
2I, 3I, 4I (100, 125)
mounting position **V6**

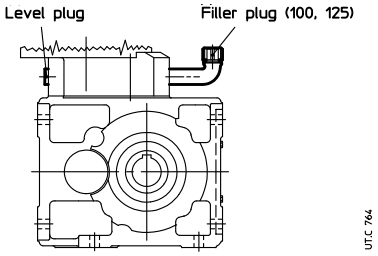
ICI (100 ... 200)
mounting position **B6**[1)]

C3I (100 ... 125)
mounting position **B6**[1)]

3I (125)
mounting position **V5**[1)]

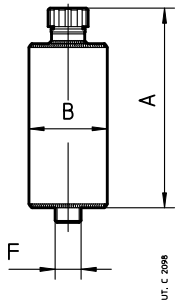






1) For high speed continuous duty an expansion tank is envisaged: consult us.

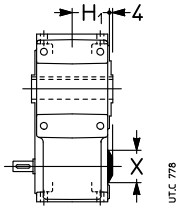
Expansion tank (sizes **100 ... 360**)



Gear reducer size	A	B	F	Plug
100 ... 140	131	46	G1/2"	1/2"
160 ... 280	205	80	G3/4"	3/4"
320 ... 360	230	102	G1"	1"

Cap overall dimension (sizes **63, 64, 125 and 140**)

In the gear reducers and gearmotors stated in the table, the cap opposite to high speed shaft overhangs of 4 mm from H_1 dimension (see ch. 8,10, 12, 14), due to backstop device pre-arrangement.

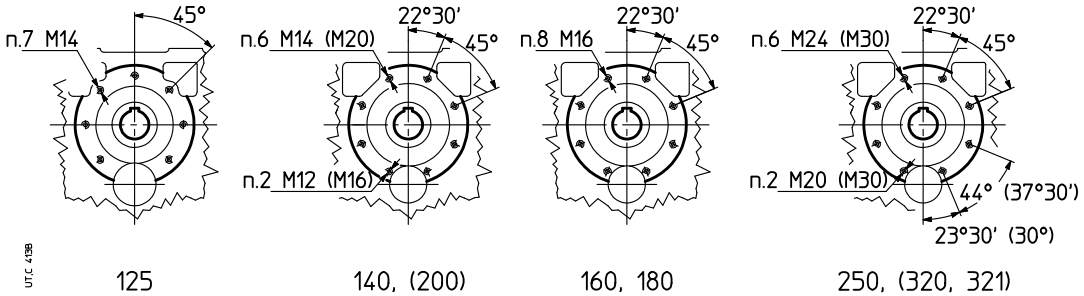


Gear reducer size		X Ø
63, 64	**R 2I, 3I and MR 2I, 3I, 4I**	47
125	**R 2I, 3I and MR 2I, 3I, 4I**	72
140	**R 2I and MR 2I**	72

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

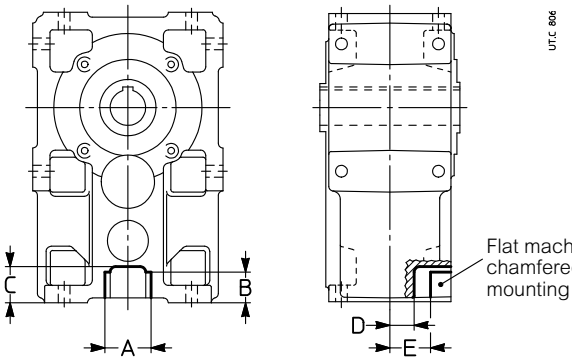
Fastening tapped holes (sizes 125 ... 321)

The relevant through holes to be realized on the driven machine must be all of equal diameter for sizes 140, 200 and 250 (Ø 15, Ø 21 and Ø 25, respectively) as the 2 holes of smaller diameter are not in the position of 22° 30'.



Reaction recess (2I, 3I, 4I sizes 40 ... 125)

Sizes 2I, 3I, 4I 40 ... 125 have a housing with a reaction recess having machined lateral surfaces, laying on the high speed side (opposite to groove), for the seating of springs and torque arm end for shaft mounting (see ch. 17 «Shaft mounting arrangements»).



Gear reducer size	A H11	B	C ≈	D	E
40	23	18.5	22	14	25
50	29.7	23.5	26	15.5	28
63, 64	32.5	25.5	31	22.5	36.5
80, 81	45.8	27	36	27	41
100	63	27	38.5	36	54.5
125	67	37	52	46	64

Low speed shaft zone (sizes 140, 180, 225, 280, 360)

In standard model helical gear reducers the perspective pulley, if mounted against shaft shoulder (always advisable), can have a maximum diameter of:

– **R I**, at the distance of H1 + Q + 3 (ch. 8), 115 (size 140), 150 (size 180), 180 (size 225), 230 (size 280), 300 (size 360).

– **R 2I**, **R 3I**, at the distance H1 + Q + 3 (ch. 8), 315 (size 140), 400 (size 180), 500 (size 225), 630 (size 280), 800 (size 360).

The use of pulleys with larger diameter is allowed on condition that they don't overhang from the shaft end and provided that the maximum radial load values are observed (see ch.16); consult us if need be.

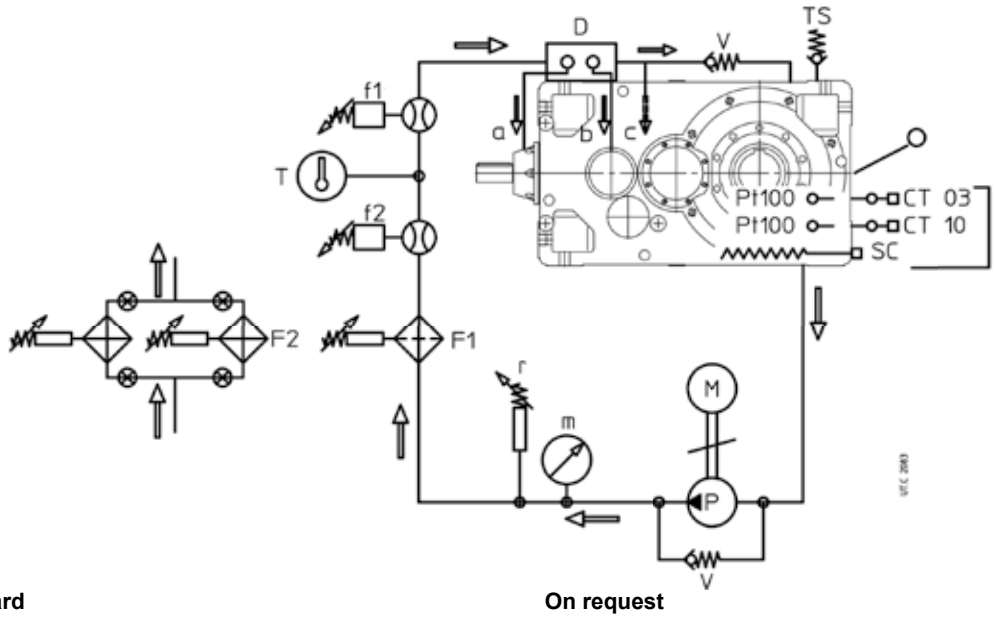
Bearing and/or gear pair forced lubrication: hydraulic circuit diagram



Standard

a, b, c	Gear pair/bearing pipes
m	Pressure gauge (0 – 16 bar)
M	Motor pump
P	Pump
T	Thermometer
V	Safety valve
r	Minimum pressure gauge
TS	Filler plug
D	Distributor
◒	Oil level (approximate)

On request

Pt 100*	Oil temperature probe (loose)*
f1	Electric flow switch: vertical mounting
f2	Visible flow switch
F1	Filter
F2	Exchange filters
CT03*, CT10*	Signalling device (loose)*
SC*	Heater

* On request, but necessary for gear reducer starting with $T_{ambient}$ (= T_{oil}) ⩽ 77 °F (25 °C): preheat the oil with the heater.

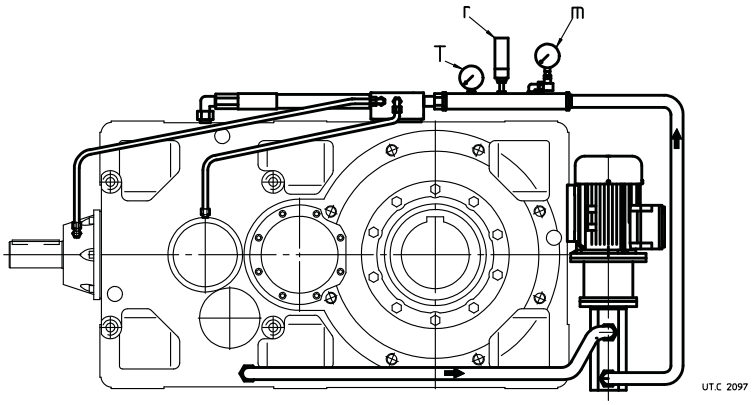
NOTES:

The bearings and/or the gear pairs to be forced lubricated are defined by Rossi according to gear reducer and application.

CT03: set the operating threshold at 122 °F (50 °C) (stopping the heater supply) and the reset threshold at 86 °F (30 °C).

CT10: set the operating threshold at 86 °F (30 °C) to start gear reducer and motor pump; set the reset threshold at 50 °F (10 °C) and the safety threshold at 194 °F (90 °C).

For the gear reducer starting at $T_{ambient}$ (= T_{oil}) ⩽ 32 °F (0 °C) the same logic is valid, but the devices CT03 and CT10 must be set according to the real ambient temperature.



Sketch of forced lubrication with motor pump; the exact position of motor pump depends on the gear reducer size, train of gears, mounting position and available overall dimensions: for this reason, on request, a drawing of the specific solution will be supplied; the pipes will be realized with suction and delivery flexible pipes and with rigid pipes between the distributor and the bearings.

Maximum bending moment of flange MR

In case of assembly of motors supplied by the customer, verify that the static bending moment T_b generated by motor weight on the counter flange of gear reducer is lower than the value allowed T_{bmax}, stated in the table:

$$T_b \leqslant T_{bmax}$$

where:

$T_b = G \cdot (X + HF) / 1000$ [lb in]

G lb] motor weight; numerically nearly equal to motor mass, expressed in kg, multiplied by 10.

X [in] distance from motor center of gravity from flange surface

HF [in] supplied in the table, according to gear reducer size and flange diameter P_1

Very long and thin motors, though with bending moments within the prescribed limits, may generate anomalous vibrations during the operation. In these cases it is necessary to foresee a proper additional motor support (see motor specific documentation).

Loads higher than permissible loads may be present in dynamical applications where the gearmotor is subjected to translations, rotations or oscillations (e.g.: shaft mounting arrangements): consult us for the study of every specific case.

Designs (direction of rotation)

R 3I 140 ... 360 – Long model

UP4A UP4D

● Position of reference groove (see ch. 6) for radial load verification.
1) Working length of thread 2 · F.
2) For dimension, number and angular position see ch. 6.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

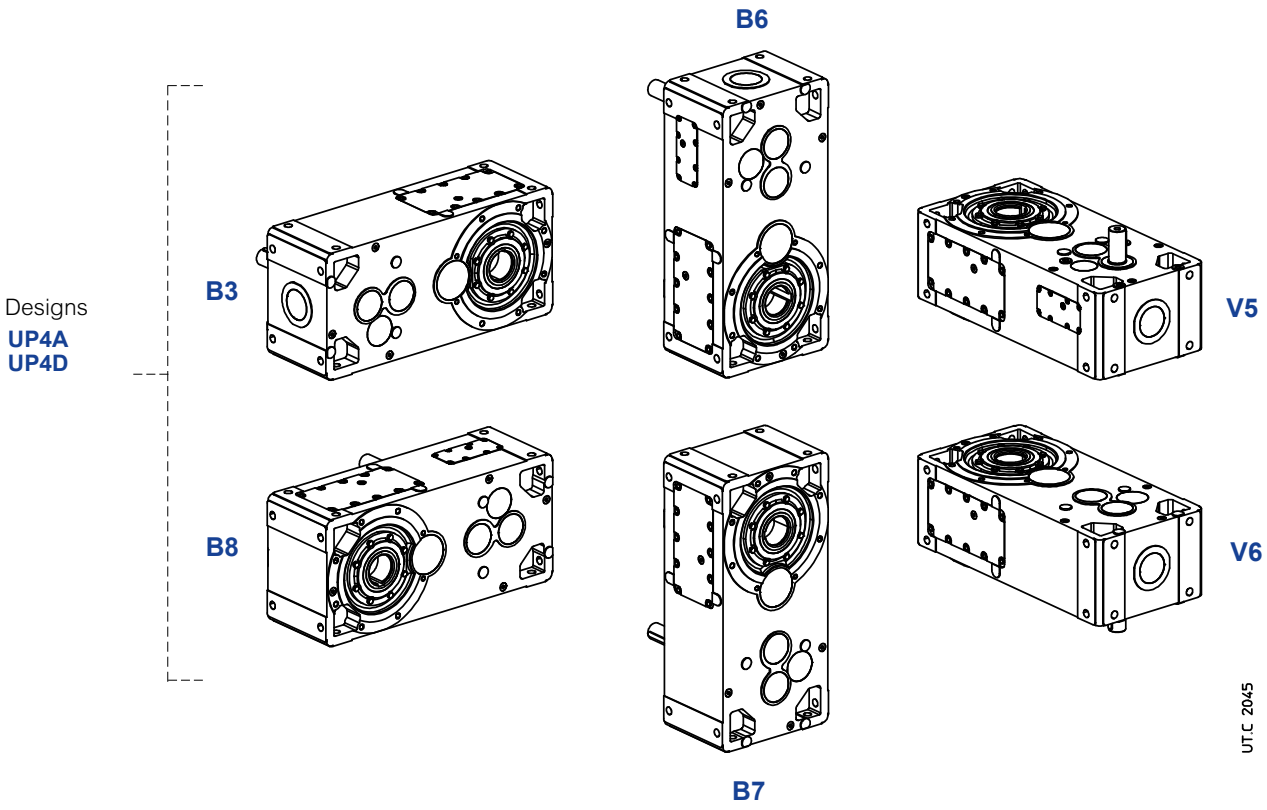
Mounting positions

Unless otherwise stated, gear reducers are supplied in mounting position **B3** (see ch. 2).

R 3I 140 ... 360 – Long model



Oil quantity R 3I 140 ... 360 – Long model

Stated oil quantities [gal] are approximate for provisioning. The exact oil quantity the gear reducer is to be filled with is defined by the level plug.

Mounting position	140	160	180	200	225	250	280	320, 321	360

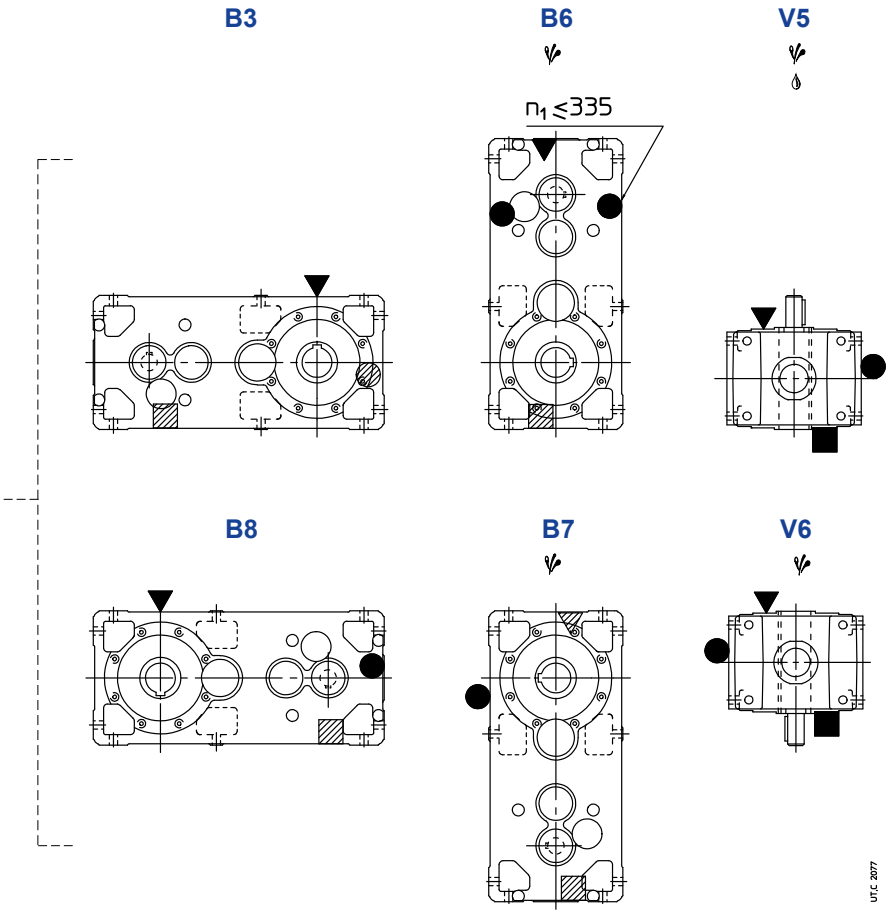
Lubrication details

R 3I 140 ... 360 – Long model

Designs:
UP4A
UP4D



Possible high oil splash: for the corrective factor f_{t_3} of nominal thermal power Pt_N see ch. 4.

Possible bearing lubrication pump or lubrication device on high speed shaft (see ch. 17 (19)).

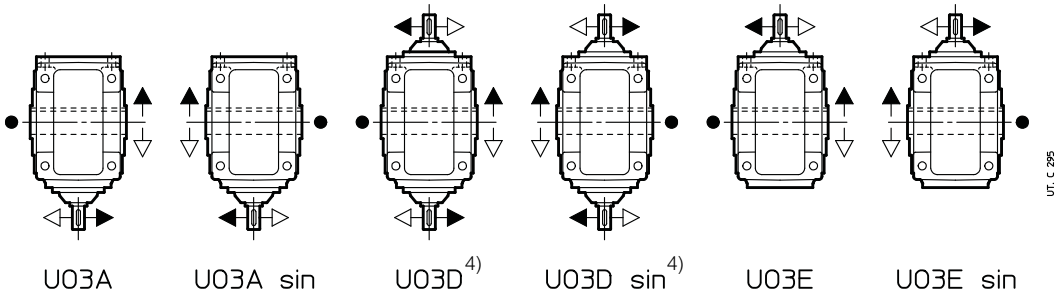
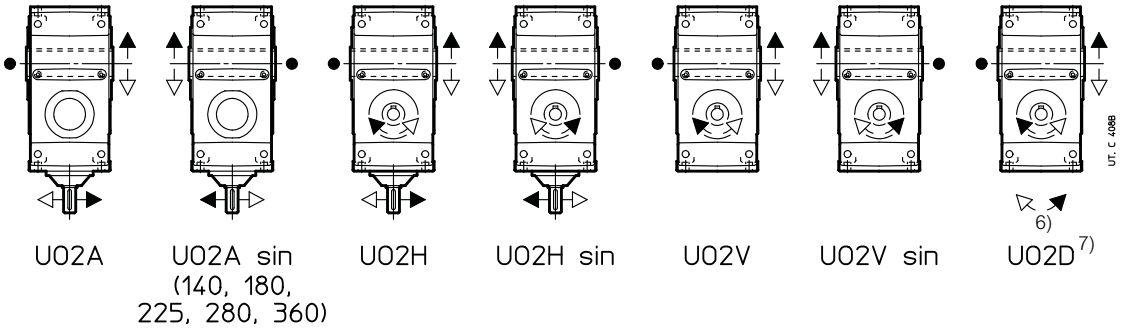
Designs (direction of rotation)

R CI 50 ... 100



R CI 125 ... 360



● Position of reference groove (see ch. 6) for radial load verification.
⁎ Machined surface and N. 2 threaded holes (dimensions in ch. 6 «Gear reducer input face») on opposite side (not in view) too.
1) Working length of thread 2 · F.
2) Working length of thread 2 · K1.
3) For dimension, number and angular position see ch. 6.
4) Not possible for size 50 with $i_N < 8$.
6) Direction of rotation of the second high speed shaft overhang not in view.
7) Design not possible for sizes 140, 180, 225, 280 and 360.

Designs (direction of rotation)

R C2I 140 ... 360

● Position of reference groove (see ch. 6) for radial load verification.
* Only No. 2 holes M 16×32 (size 160), M 20×38 (size 200), M 24×46 (size 250) and M 30×58 (sizes 320 and 321) and not for design UO2A.
* *Machined surface and N.4 threaded holes (dimensions in ch. 6 «Gear reducer input face») on opposite side (not in view) too.
1) Working length of thread 2 · F.
2) For dimension, number and angular position see ch. 6.
3) The housing of this design is not pre-arranged for the other designs.

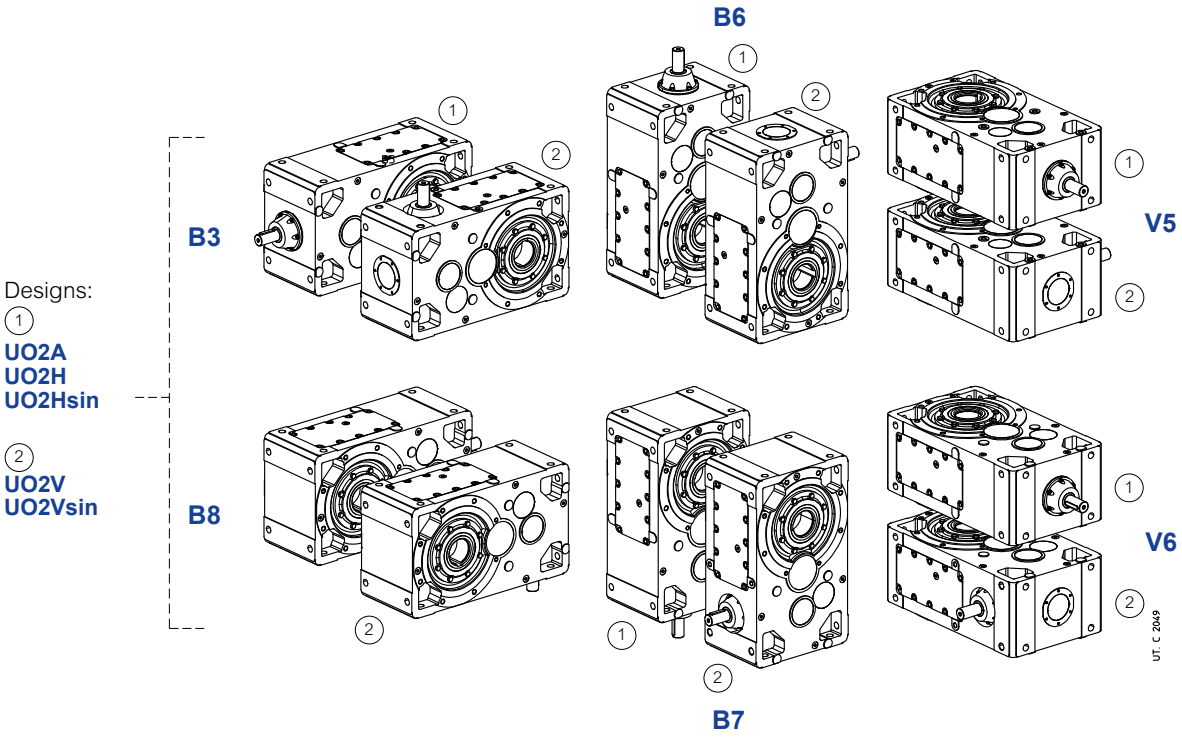
Mounting positions

Unless otherwise stated, gear reducers are supplied in mounting position **B3** (see ch. 2).

R C2I 140 ... 360



Oil quantity R C2I 140 ... 360

Stated oil quantities [gal] are approximate for provisioning. The exact oil quantity the gear reducer is to be filled with is defined by the level plug.

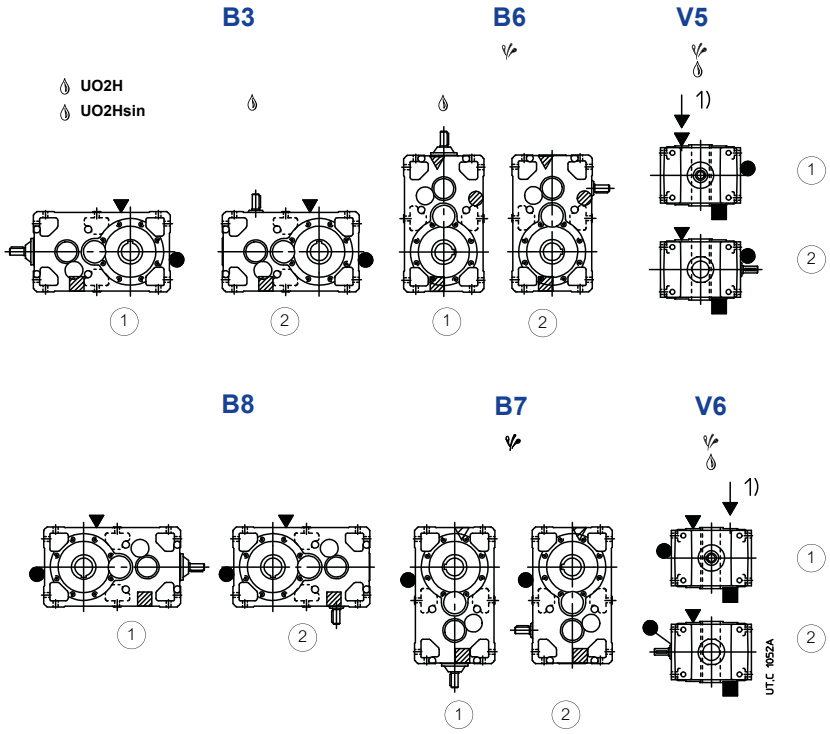
Lubrication details

R C2I 140 ... 360

Designs:
(1)
UO2A
UO2H
UO2Hsin
(2)
UO2V
UO2Vsin



1) Position of intermediate hole for mounting position identification.
Possible high oil splash: for the corrective factor f_{t_3} of nominal thermal power P_{t_N} see ch. 4.
Possible bearing lubrication pump or high speed shaft lubrication device (see ch. 17 (19)).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case M_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).
** Mounting position **B5A** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case M_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).
** Mounting position **B5A** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case M_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case M_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case M_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case M_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case M_2 increases and f_S decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case M_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case M_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

Important note.

In the following pages, the gearmotor weight and dimensions X, Y, Y_2, W, W_1, W_2 are referred to the aluminium light alloy frame IEC electric motor of cat. TX11, up to motor size 132 included. For higher motor sizes these values are approximate and may vary according to the specific motor adopted; consult us, if need be.

The dimensions are expressed in mm

Mounting positions

Unless otherwise stated, gear reducers are supplied in mounting position **B3** (see ch. 2).

MR 3I 80 ... 125 – Long model

MR 3I 140 ... 225 – Long model

Oil quantity MR 3I 80 ... 225 – Long model

Lubricant quantities [gal] stated in the table are approximate for provisioning. The exact oil quantity the gear reducer is to be filled with is defined by the level plug.

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case T_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.

1) Powers valid for continuous duty S1; **increase possible**
for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case T_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case T_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case T_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case T_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Potenze per servizio continuo S1; per servizi S2 ... S10 è possibile **incrementarle** (ved. cap. 1 «Caratteristiche generali»): proporzionalmente T_2 aumenta e fs diminuisce.
2) Per la designazione completa per l'ordinazione ved. cap. 2.

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case T_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case T_2 increases and f_S decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case T_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case T_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.
* Mounting position **B5R** (see ch. 1.2).

1) Powers valid for continuous duty S1; **increase possible** for duty cycles S2 ... S10 (see ch. 1 «General specifications»): in which case T_2 increases and fs decreases.
2) For complete designation when ordering see ch. 2.

14 – Dimensions, designs, mounting positions of bevel helical gearmotors

14.1 - Gearmotors MR CI 278

Dimensions 278
Designs (direction of rotation) 280
Mounting positions 281
Lubrication details 282

14.2 - Gearmotors MR ICI 283

Dimensions 283
Designs (direction of rotation) 284
Mounting positions 284
Lubrication details 285

14.3 - Gearmotors MR C3I 286

Dimensions 286
Designs (direction of rotation) 286
Mounting positions 287
Lubrication details 288

14.4 - Gearmotors MR C2I 289

Dimensions 289
Designs (direction of rotation) 290
Mounting positions 291
Lubrication details 292

Important note.

In the following pages, the gearmotor weight and dimensions X, Y, Y_2, W, W_1, W_2 are referred to the aluminium light alloy frame IEC electric motor of cat. TX11, up to motor size 132 included. For higher motor sizes these values are approximate and may vary according to the specific motor adopted; consult us, if need be.

The dimensions are expressed in mm

1) Working length of thread 2 · F.
2) Values valid for brake motor.
3) On request and with price addition, dimension P_1 = 160: consult us.
4) Mounting position **B5R** (see ch. 1.2).
5) On request for 100LB 4, 112M 4 and 132M 4 also mounting position **B5R** (see ch. 1.2; dimensions Y and Y_2 increase by 27 mm, 26 mm and 35 mm, respectively).

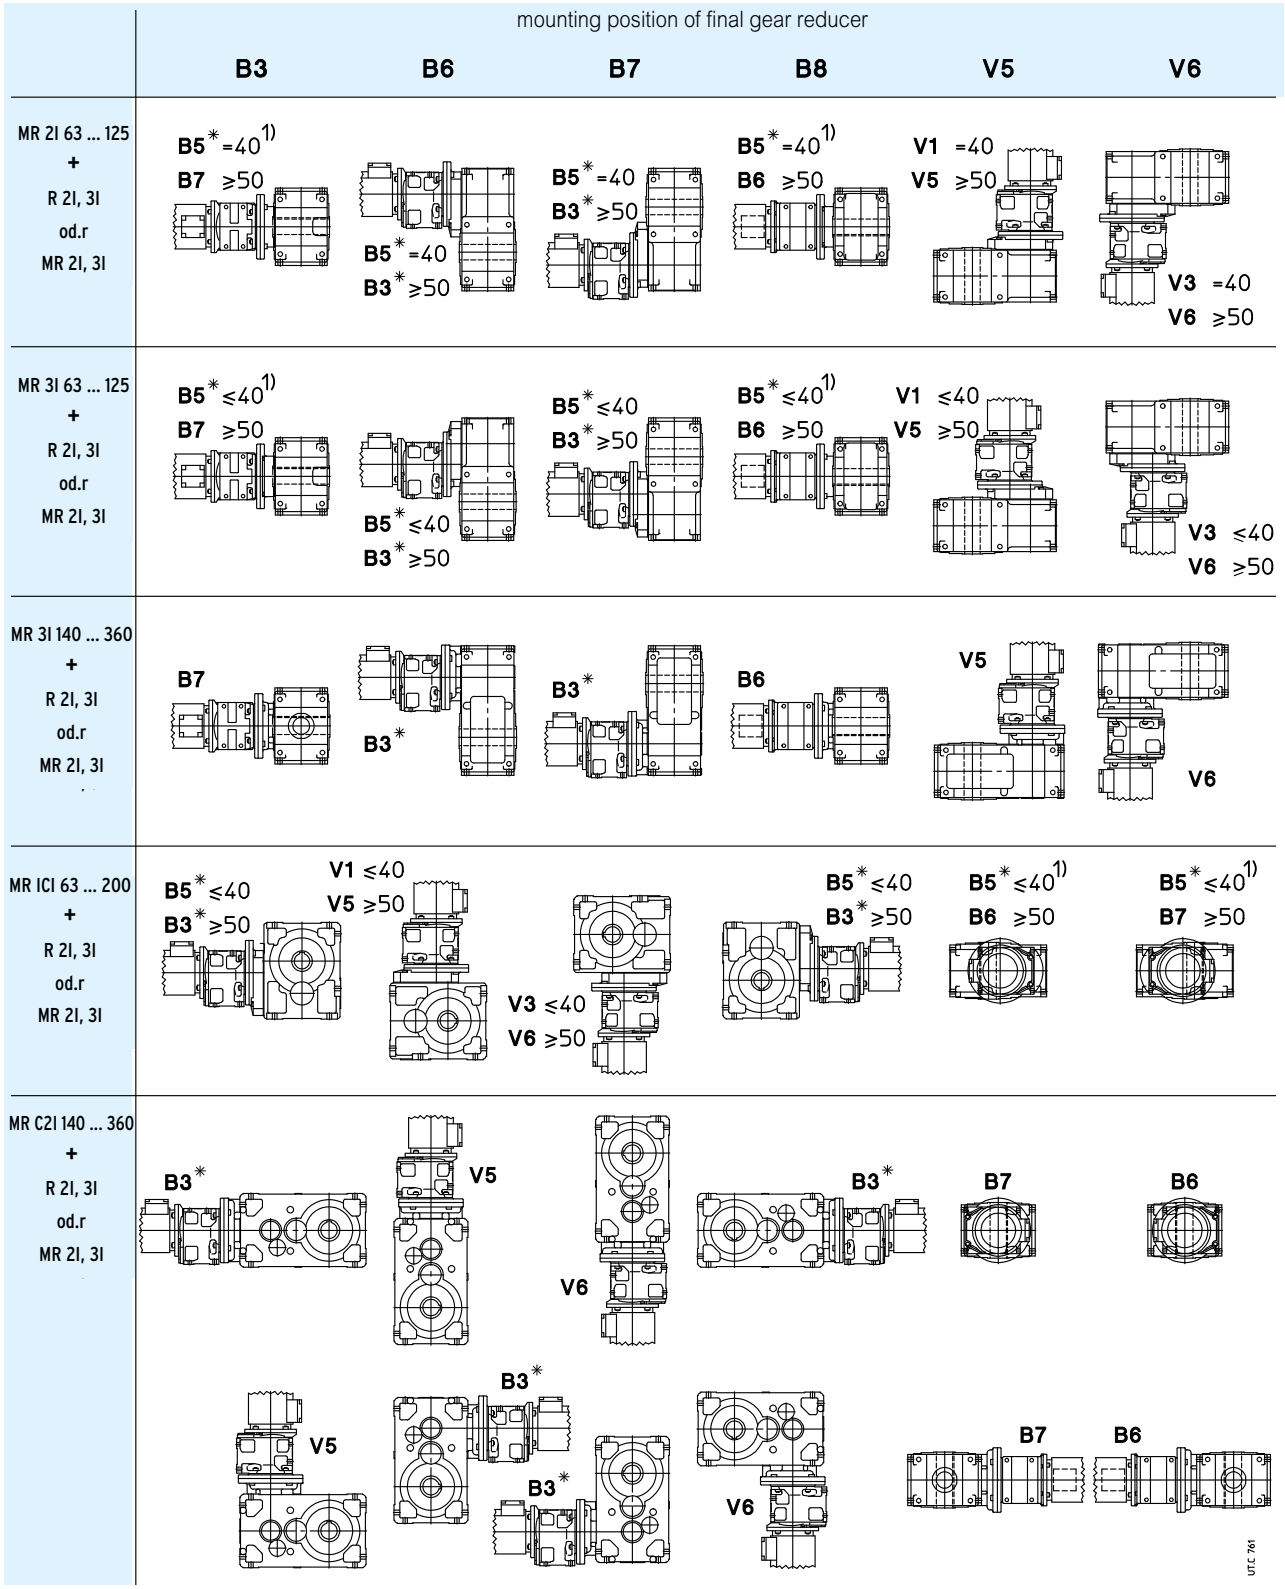
Initial gear reducer or gearmotor mounting position

In order to make easier the individualization of the combined gearmotors mounting position refer to the following table where, according to the type, to the mounting position and to the final gear reducer, the mounting positions of the initial gear reducer or gearmotor are stated.

Initial **gear reducer or gearmotor** mounting position



* This mounting position, being standard, must not be stated in the designation.
1) Grease quantity is the same foreseen for B3 mounting position in cat. E.
On name plate there is a * in correspondence of mounting position.

The radial load *F*r1 given by the following formula refers to most common:

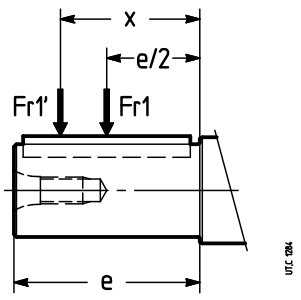
$$F_{r1} = \frac{189\,090 \cdot P_1}{d \cdot n_1}$$ [lb] for timing belt drive

$$F_{r1} = \frac{315\,150 \cdot P_1}{d \cdot n_1}$$ [lb] for V-belt drive

where:
P_1 [hp] is the power required at the input side of gear reducer;
n_1 [rpm] is the speed;
d [in] is the pitch diameter.

Radial loads given in the table are valid for overhung loads on centre line of high speed shaft end, i.e. operating at a distance of 0.5 · e (e = shaft end length) from the shoulder. If radial loads are in a different position, i.e. at a distance differing from 0.5 · e from shoulder, re-calculate the permissible value of radial load according to the following formula, trying not to exceed the maximum value F_{r1max}, stated in the table:

$$F_{r1}' = F_{r1} \cdot \frac{e/2 + y}{x + y}$$ [lb]



where:
F_{r1}' [lb] is the permissible radial load acting at the distance x from shaft shoulder;
F_{r1} [lb] is the permissible radial load acting on centre line of high speed shaft end (see table above);
e [mm] is shaft end length (see ch. 8, 10);
y [mm] is given in the table;
x [mm] is the distance between the shaft shoulder and the load application point.

It is always advisable **to mount the pulley against the shaft shoulder** and in any case to avoid that the pulley exceeds the shaft end.

An **axial load** of up to 0.2 times the value in the table is permissible, simultaneously with the radial load.

In absence of the radial load, an axial load may be acting on center line, not higher than 0.5 times the stated radial load.

IMPORTANT: tabulated values for radial load *F*r1 can increase considerably in certain instances (direction of rotation, angular position of load, etc.). If necessary and/or in presence of **misaligned** axial loads, consult us.

16.1 - Radial loads F_{r1} [N] on high speed shaft end

V-belt drives

In the table the motor pulleys are given for the several power and motor polarity, together with radial loads present on motor and gear reducer motor shaft.

The drives have been calculated with a service factor ⩾1.4; in order to increase the service factor with same ***d*** value and number of belts, replace section SPA with SPB, section SPB with SPC, section SPC with 8V.

The radial loads have been calculated according to the formula $\frac{315\,150 \cdot P_1}{d \cdot n_1}$.

Radial load F_{r1}, relevant to the motor pulley selected, must be less than or equal to the one permitted by gear reducer.

IMPORTANT: for the good drive running and in order not to overload the motor and gear reducer bearings, reduce the overhang to a minimum and do not stress the belts excessively. The pulleys with ***d*** ⩾ 16 must be dynamically balanced.

Motor			Motor pulley: belt number and section, pitch diameter ***d*** [in], radial load F_{r1} [lb]														
P_1 hp	Size and pole n.			***d***	F_{r1} ≈		***d***	F_{r1} ≈		***d***	F_{r1} ≈		***d***	F_{r1} ≈		***d***	F_{r1} ≈

16.2 - Axial loads F_{a2} [lb] or radial loads F_{r2} [lb] on low speed shaft end

Axial loads F_{a2}

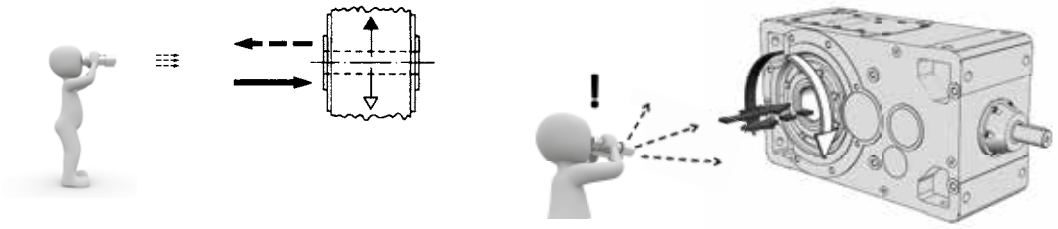
Permissible *F*a2 is shown in the column where direction of rotation of low speed shaft (black or white arrow) and direction of the axial force (solid or broken arrow) correspond to those of the gear reducer in question. Direction of rotation and direction of force may be established viewing the gear reducer from any point (from groove side or from opposite side to groove, indifferently), providing the same point is adopted for rotation and axial load (see fig. below).

Notes:

– White and black arrows of present chapter do not refer to the ones stating the correspondence of direction of rotation for the different designs (see ch. 8, 10, 12, 14);

– Wherever possible, choose the load conditions corresponding to the column with the highest admissible values.

– The values stated in the table are valid for the center line axial load; in the event of a misaligned axial load, consult us.



Radial loads F_{r2}

Radial loads generated on the shaft end by a drive connecting gear reducer and machine must be less than or equal to those given in the following pages.

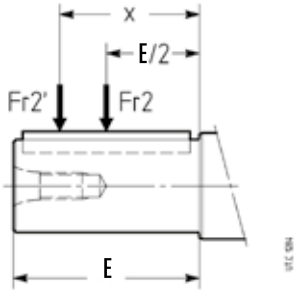
Normally, radial loads on low speed shaft ends are considerable: in fact there is a tendency to connect the gear reducer to the machine by means of a transmission with high transmission ratio (economizing on the gear reducer) and with small diameters (economizing on the drive, and for requirements dictated by overall dimensions).

Bearing life and wear (which also affect gears unfavourably) and low speed shaft strength, clearly impose limits on permissible radial load.

The permissible radial loads stated in the tables are according to: low speed shaft end where the radial load is applied according to reference groove (see ch. 6) of the product of angular speed n_2 [rpm] multiplied by the bearing life required L_h [h], of direction of rotation, of angular position φ [°] of load and of torque required T_2 [lbf in].

The radial loads given in the tables are valid for loads on shaft center line of low speed shaft, i.e. at a distance from shoulder of 0,5 · E (E = shaft end length); in the event of radial load acting in a different position (not center line), i.e. at a distance from shoulder different from 0,5 · E, re-calculate the permissible value of radial load according to the following formula, verifying simultaneously not to exceed the maximum value F_{r2max}, given in the tables.

$$F_{r2}' = F_{r2} \cdot \frac{E/2 + y}{x + y} \quad [lb]$$



where:

F_{r2}' [lb] is the permissible radial load acting at distance x from the shoulder;

F_{r2} [lb] is the permissible radial load acting on center line of high speed shaft end (see table on following pages);

E [mm] is the shaft end length (see ch. 17);

y [mm] is given in the table;

x [mm] is the distance of load application starting from shaft shoulder.

16.2 - Axial loads F_{a2} [lb] or radial loads F_{r2} [lb] on low speed shaft end

Chain drives

This drive is usually advised for low tip speeds (v ⩽ 0.5 ft/s with periodical lubrication, v ⩽ 1.5 ft/s with drop lubrication) and for this reason it is usually placed between gear reducer and machine. Compared with gear transmissions it offers the advantage of a high flexibility, allowing larger misalignements and higher distances among the shaft to be connected.

On the other hand, it is less suitable with alternate shock operations, in particular with high tip speed (shocks, noise, clearance worsening) and requires a specific maintenance as it is subjected to wear and periodic clearance taking up.

For the correct belt drive dimensioning refer to specific manufacturer's literature; as a rough guide, we can assume:

$$p \approx 0{,}5 \cdot D$$
$$d = p \cdot z / \pi$$

where:

p chain pitch

D diameter of gear reducer shaft end

d pinion pitch diameter

z pinion number of teeth

Keep in mind that the number of pinion teeth ***z***, except some particular cases, should be at least **17** (the numbers of teeth classically adopted are: 17, 19, 21, 23) and that the smaller the pitch, the quieter the chain;

As a rough guide, for a rapid evaluation of the radial load generated on the low speed shaft end of gear reducer by a chain drive, see the table including:

– the **pitch diameter** values ***d*** of pinion and the **maximum transmissible power**, for two pinion speeds, according to pitch ***p*** and teeth number ***z***

– the **maximum pinion width** b_{max}, the **mass** and the **maximum breaking load** R_R of chain, according to the pitch and to the chain (simple, double or triple).

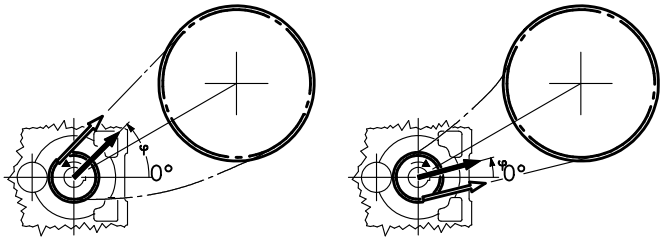
16.2 - Axial loads F_{a2} [lb] or radial loads F_{r2} [lb] on low speed shaft end

Radial load F_{r2} for most common drives has the following value and angular position:

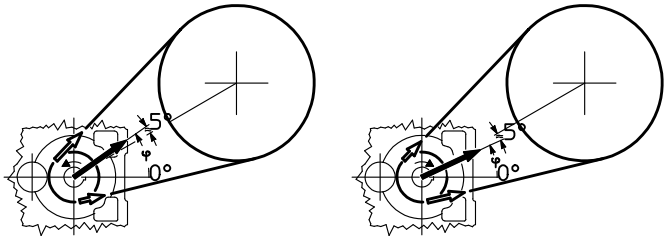
$$F_{r2} = \frac{126\,000 \cdot P_2}{d \cdot n_2}\ [\text{lb}]$$

for chain drive (lifting in general); for timing belt drive replace 126 000 with 189 090



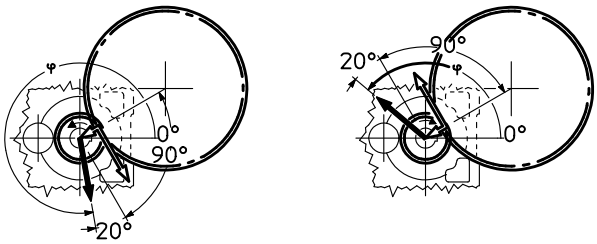
$$F_{r2} = \frac{315\,150 \cdot P_2}{d \cdot n_2}\ [\text{lb}]$$

for V-belt drive



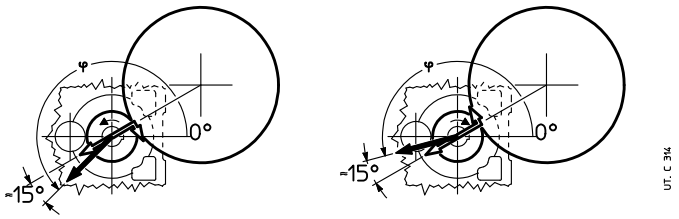
$$F_{r2} = \frac{134\,110 \cdot P_2}{d \cdot n_2}\ [\text{lb}]$$

for spur gear pair drive



$$F_{r2} = \frac{447\,550 \cdot P_2}{d \cdot n_2}\ [\text{lb}]$$

for friction wheel drive (rubber-on-metal)



where: P_2 [hp] is power required at the output side of the gear reducer, n_2 [rpm] is the speed, d [in] is the pitch diameter.
IMPORTANT: 0° coincides with a straight line concurrent with the axis of the last reduction and orientated as shown above, and therefore it follows the rotation of the housing, as shown below.

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.

max		**1 800**																**1 250**	**630**

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.

max		**2 800**																**1 000**	**2 000**

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.

max		**2 800**																**1 000**	**2 000**

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.
3) An unfavourable direction of load can limit F_{r2} to 0.9 · F_{r2max}.

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.
3) An unfavourable direction of load can limit F_{r2} to 0.9 · F_{r2max}.

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.
3) An unfavourable direction of load can limit F_{r2} to 0.9 · F_{r2max}.

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.
3) An unfavourable direction of load can limit F_{r2} to $0.9 \cdot F_{r2max}$.
4) With hollow low speed shaft F_{r2} and F_{a2} permissible is 0.4 times the one stated in the table.

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.
3) An unfavourable direction of load can limit F_{r2} to 0.9 · F_{r2max}.
4) With hollow low speed shaft F_{r2} and F_{a2} permissible is 0.4 times the one stated in the table.

max		**25 000** (**14 000** for «short side»)																**8 000**	**16 000**

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.
3) An unfavourable direction of load can limit F_{r2} to .,9 · F_{r2max}.
4) With hollow low speed shaft F_{r2} and F_{a2} permissible is 0.4 times the one stated in the table.

max		**25 000** (**14 000** for «short side»)																**8 000**	**16 000**

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.
3) An unfavourable direction of load can limit F_{r2} to $0.9 \cdot F_{r2max}$.
4) With hollow low speed shaft F_{r2} and F_{a2} permissible is 0.4 times the one stated in the table.

max		**40 000** (**22 400** for «short side»)																**25 000**	**12 500**

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.
3) An unfavourable direction of load can limit F_{r2} to 0.9 · F_{r2max}.
4) With hollow low speed shaft F_{r2} and F_{a2} permissible is 0.4 times the one stated in the table.

1) An axial load of up to 0.2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.
2) For radial loads acting simultaneously on both sides consult us.
3) An unfavourable direction of load can limit F_{r2} to 0.9 · F_{r2max}.
4) With hollow low speed shaft F_{r2} and F_{a2} permissible is 0.4 times the one stated in the table.

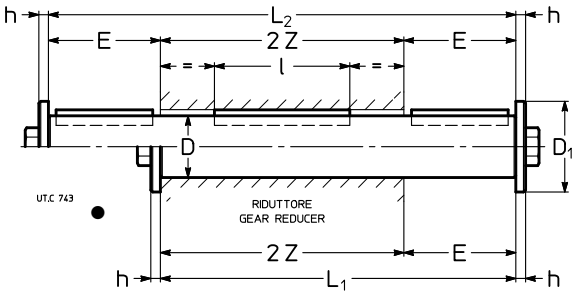
(1) Low speed shaft (sizes 40 ... 360)

This accessory is mounted on the gear reducer. The standard mounting position is with shaft and on opposite side to groove. For opposite mounting position, when possible (for some helical gearmotors MR 2I 40 ... 81 and MR 3I 40 ... 125 (model 2), the low speed shaft cannot overhang from motor side: consult us), state after the designation «groove side assembly».

The external diameter of the element or of the spacer abutting with the gear reducer must be (1.25 – 1.4) · **D**; hole tolerance D H7 ... K7.

Other dimensions at ch. 6 «High and low speed shaft end».

Supplementary description when ordering by **designation**: **standard** or **double extension low speed shaft**.



● Position of the reference groove (see ch. 16) for radial load verification.

Size	D Ø	E	D1 Ø	h	L1	L2	l	2 Z	Screw UNI 5737-88	lb Standard	lb Double ext.

1) Value **not** to standard; with double extension low speed shaft E = 101.
2) Value **not** to standard.
3) For MR 3I the dimension E increases of 1.

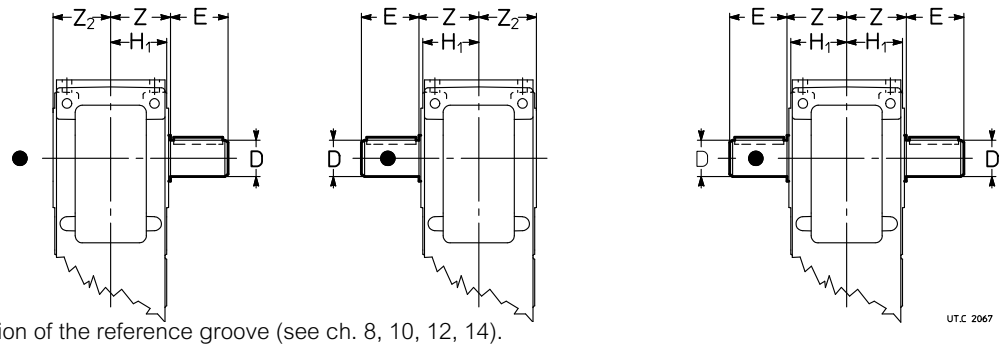
Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(2) Solid low speed shaft (sizes 100 ... 360)

Gear reducers and gearmotors sizes 100 ... 360 can be supplied with solid low speed shaft overhanging from groove opposite side, from groove side or from double extension. For sizes 225, 280, and 360 the design foresees oversized bearings in order to allow high radial loads stated on ch. 16. In some cases with sizes MR 2I 40 ... 81 and MR 3I 40 ... 125 the low speed shaft cannot be foreseen on the motor size (excluding the «long» model 4).

Other dimensions at ch. 6 «High and low speed shaft end».

1) As alternative to the (not double extension) solid low speed shaft, for sizes 64 ... 81 it is possible to supply the standard low speed shaft axially fastened; the fastening is realized with retaining ring and the dimension E (see ch. 17 (1)) increases by 8 mm: consult us.



● Position of the reference groove (see ch. 8, 10, 12, 14).

100	50	14 × 9 × 125	14	6.5[1)]	52.8[1)]

* Recommended length.
1) Values **not** to standard.
2) Without retaining ring groove.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

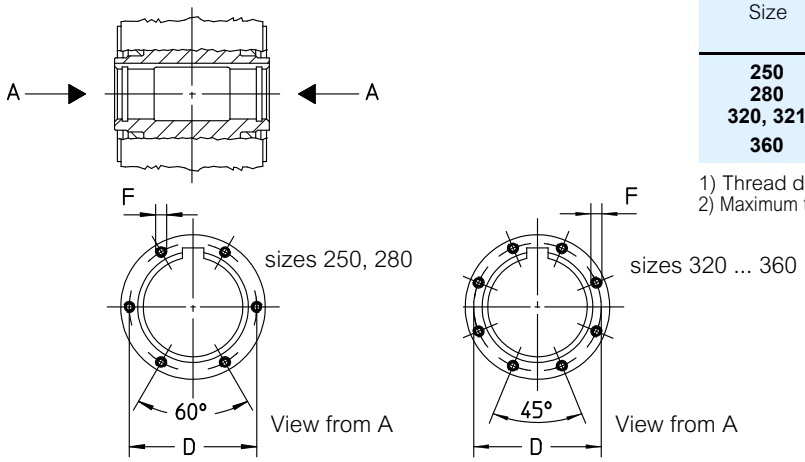
(4) Hollow low speed shaft with front holes (sizes 250 ... 360)

Hollow low speed shaft, sizes 250 … 360, including tapped holes. The dimensions of tapped holes and the maximum axial force deriving from relevant screws class 8.8 are stated in the table.

ATTENTION. **This axial load can be unsufficient to assure the disassembly of gear reducer from machine shaft end**. In fact, according to the selected coupling tolerances to realize the machine shaft end and according to the coupling status – determined by installation environment and duty cycle (e.g.: alternate cycles, with overloads, etc.) – the disassembly operation could require an extraction force even much higher than the thread capacity that could be damaged irremediably.

In these cases, it is necessary to adopt an extraction system through hollow low speed shaft bushing (see ch. 17 (20)).

Supplementary description when ordering by **designation**: **hollow low speed shaft with front holes**.



Size	D Ø	F[1]		α [°]	$F_{a\,max}$[2] [lb]
250	144	M8	nr.6	60	22 250
280	162	M10	nr.6	60	35 300
320, 321	182	M10	nr.8	45	47 000
360	212	M12	nr.8	45	68 800

1) Thread depth 2·F.
2) Maximum total axial load relevant to bolts class 8.8.

(5) Stepped hollow low speed shaft (sizes 64 ... 360)

Gear reducers and gearmotors sizes 64 ... 360 can be also supplied with stepped hollow low speed shaft always with keyway; this design **facilitates** installation and removal and **affords a notable increase** in rigidity and resistance to bending and torsional stresses at the shaft end of the driven machine.

Hole with Ø **D_2** is always **opposite to groove side**.

Important: the shoulder diameter of the driven machine shaft end abutting with the gear reducer must be at least (1.18 – 1.25) · D.

Supplementary description when ordering by **designation**: **stepped hollow low speed shaft**.

(6) Hollow low speed shaft with shrink disc (sizes 40 ... 360)

Sizes 40 ... 125

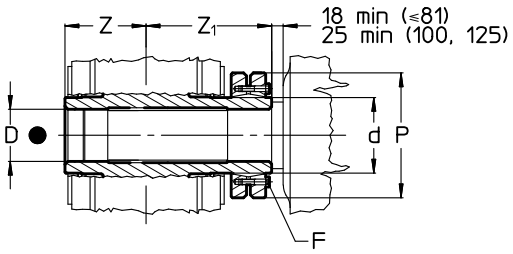
Gear reducers and gearmotors sizes 40 ... 125 can be supplied with hollow low speed shaft with shrink disc (see fig. a) – **always opposite side to groove** i.e. opposite side to motor for helical gearmotors – and not rotating protection cap on groove side (excluding input side of helical gear reducers and gearmotors sizes 40, 50 and MR 3I 63).

This design affords a notable increase in rigidity of keying and **reduces** the deformations of shaft end of driven machine (high mass **D**), also permits couplings with passing through shafts (only for bevel helical or long model see fig. c) eventually **avoiding**, when interposed between gear reducer and machine, the necessity of safety guards on the unit itself.

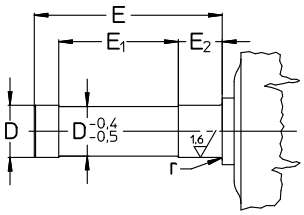
For the shaft end of driven machine on which gear reducer hollow low speed shaft (see fig. b) must be keyed, it is recommended to respect the dimensions stated in the table.

Important: the shoulder diameter of the driven machine shaft end abutting with the gear reducer must be at least (1.18 – 1.25) · D.

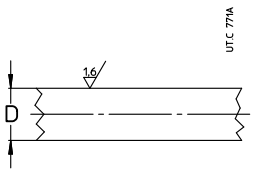
Supplementary description when ordering by **designation**: **hollow low speed shaft with shrink disc**



a) Hollow low speed shaft with shrink disc and shaft end of driven machine



b) Shaft end of driven machine



c) Through shaft of driven machine

Size	D Ø H7/j6, h6[1]	E 4)	E_1	E_2 4)	F UNI 5737-88 cl. 10.9	T_s lb in 2)	d	P	r	Z	Z_1	$T_{2\,SD}$ lb in 3)

1) Tolerance g6 also possible for shaft end opposite to shrink disk.
2) Tightening torque.
3) Maximum values for shrink disc.
4) In presence of «Labyrinth seal and low speed shaft grease» (ch. 17 (26)), in case of mounting of the shrink disc on machine opposite side, it is necessary to increase the E (E_2) dimension by A quantity stated in the table on ch. 17 (26).
● Position of the reference groove (see ch. 8,10, 12,14).
For design with labyrinth seals at low speed shaft, the dimensions E, E_1, E_2 are changing: please consult us.

For sizes 80 ... 125 and **train of gears CI and ICI**, it is possible to obtain the **shrink disc opposite side to machine** by selecting a suitable mounting position and design (direction of rotation). A protection for the shrink disc is supplied as standard, see page 328.

Sizes 140 ... 360: side to machine

Gear reducers and gearmotors sizes 140 ... 360 can be supplied with **stepped** hollow low speed shaft with shrink disc **side to machine** – that is **opposite side to groove**, i.e. opposite side to motor for helical gearmotors – and not rotating protection cap on groove side.

This design **facilitates** installation and removal and **affords a notable increase** in rigidity of keying and **reduces** the deformations of machine shaft end, avoids possible problems of interference between shrink disc and motor flange (for helical gear units) and may **avoid** the use of safety guards on the unit itself. Moreover, since deformability of keying area is greater ($d - D_2 < d - D$) and friction area acts on a greater diameter ($D_2 > D$), maximum transmissible torque increases by 18 – 25% compared to the solution with shrink disc on opposite side to machine.

For a further axial fastening and in order to facilitate the assembling and disassembling operations (see ch. 18), it is possible to make use of hollow low speed shaft washer with retaining ring and bolt for axial fastening (on request).

For the shaft end of driven machine on which gear reducer stepped hollow low speed shaft must be keyed, it is possible to adopt both «long» and «short» shaft end of driven machine: dimensions as per table (for the other dimensions see ch. 18).

In the first case (fig. c), the assembly operations are facilitated, acting the «long» pivot as a guide. The possible application of a locking bushing with hollow low speed shaft washer (fig. d), reducing the fretting corrosion at the very least, especially facilitates the disassembling operations by giving at the same time a help in the torque transmission.

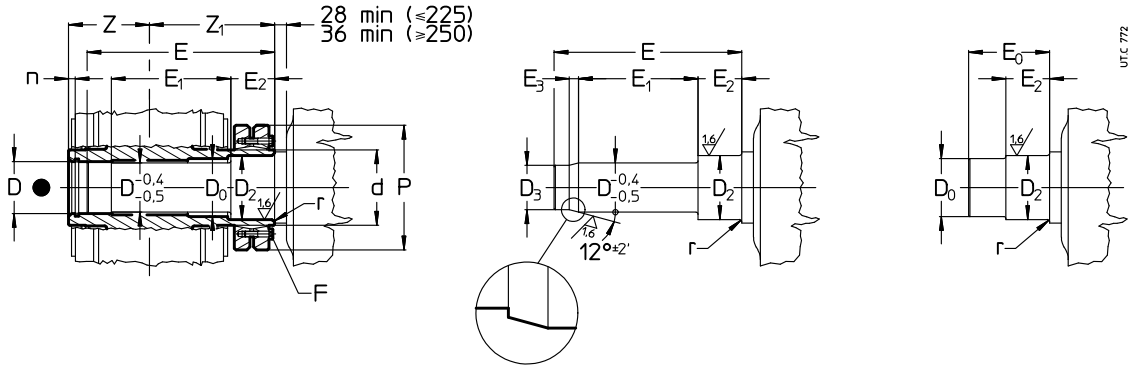
In the second case (fig. e), the reduced axial dimension of the «short» shaft end of driven machine, limits the mounting and removing overall dimensions at the very least.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

In both cases the rigidity and the resistance to bending and torsional stresses at the shaft and of driven machine do not change, since the only surface through which torque transmission occurs is the D_2 one.

Important: the shoulder diameter of the driven machine shaft end abutting with the gear reducer must be at least (1,18 – 1,25) · D.

Supplementary description when ordering by **designation: hollow low speed shaft with shrink disc, on machine side.**



c) Stepped hollow low speed shaft with shrink disc and «long» machine shaft end

d) «Long» shaft end of driven machine also for locking bushing

e) «Short» shaft end of driven machine

1) Tightening torque.
2) Max transmissible torque relevant to shrink disc; in case of «Short shaft end» (fig. e), consult us.
● Position of the reference groove (see ch. 6).
For design with labyrinth seals at low speed shaft, the dimensions E, E1, E2 are changing: please consult us.

Sizes 140 ... 360: side opposite to machine

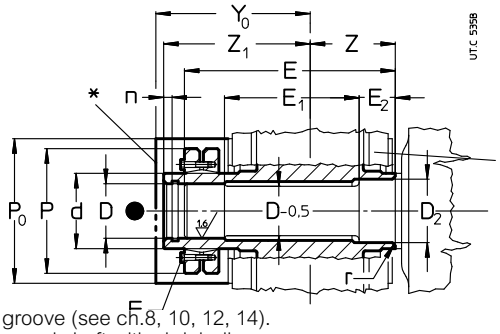
Gear reducer and gearmotor sizes 140 ... 360 can be supplied with **stepped** hollow low speed shaft with shrink disc on **opposite machine side**, i.e. **groove side** (see fig. f).

A protection for the shrink disc is supplied as standard, see page 328.

This design, compared with the machine side design, improves the accessibility to the shrink disc but it is more expensive, with lower torsional stiffness and with limits in the max admissible motor size for MR 2I ... UP2 ...; the shrink disc transmits a lower torque and, normally, requires a personal safety-guard (see «Protection for hollow shaft with shrink disc»).

Important: the shoulder diameter of the driven machine shaft end abutting with the gear reducer must be at least (1.18 – 1.25) · D.

Supplementary description when ordering by **designation: hollow low speed shaft with shrink disc, on machine opposite side.**



Hollow low speed shaft zone to be protected against fretting corrosion.

f) Stepped hollow low speed shaft with shrink disc and machine shaft end.

● Position of the reference groove (see ch.8, 10, 12, 14).
* Protection for hollow low speed shaft with shrink disc.

3) In presence of «Labyrinth seal and low speed shaft grease» (ch. 17 (26)), it is necessary to increase the E dimension (E_2) by A quantity stated in the table on ch. 17 (26).

(7) Protection for hollow low speed shaft with shrink disc

Safety protections, made of steel, for gear reducers equipped with hollow low speed shaft with shrink disc on machine opposite side (groove side). Normally supplied as standard when ordering the option low speed shaft with shrink disc. For details see below.

Sizes 140 ... 360

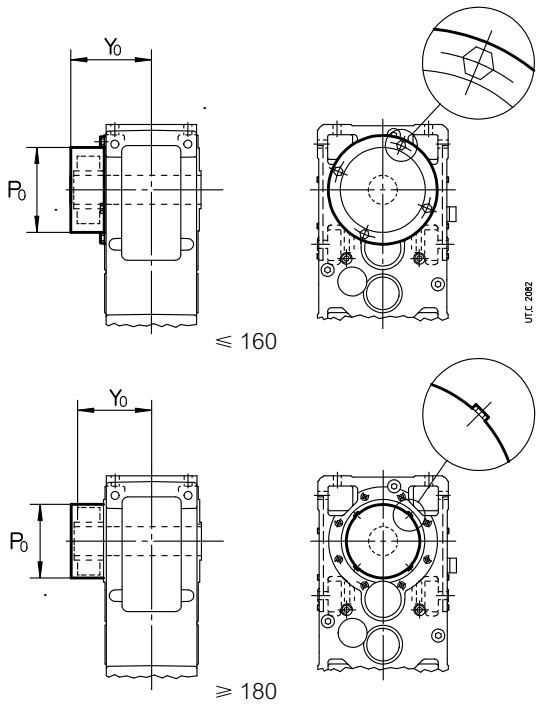
For dimensions and assembly sketch see «Low speed shaft with shrink disc on machine opposite side».

The accessory **cannot be supplied** for:

– **R I** gear reducers;

– gear reducers and gearmotors in vertical mounting positions **V5** and **V6 with shrink disc uppermost**;

– **some combined units of helical gearmotors** (UP**2**...) stated in the **table** (for the other gearmotor combined units this accessory will be available).



Size MR 2I, 3I UP**2**...	B5 motor size incompatible with accessory
140	⩾ 100
160	⩾ 160

(8) Flange (sizes 40 ... 360)

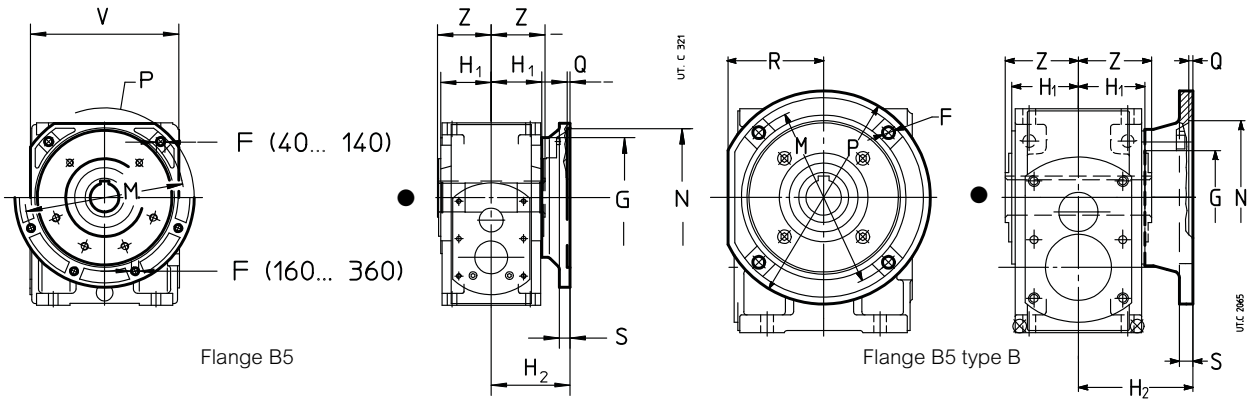
All gear reducers and gearmotors can be supplied with B5 flange having clearance holes and spigot «recess».

For sizes 63 ... 81, it is available in two versions with different coupling dimensions: **B5 flange** and **B5 flange type B**.

The accessory is supplied fitted onto the gear reducer. Unless otherwise stated, the mounting position is on groove opposite side (input opposite, for helical gear units: for these sizes 40 ... 125 is the only one possible; for greater sizes, consult us). For groove side mounting position (for bevel helical gear units only), state in the designation: «**mounting on groove side**». Locking adhesives such as LOCTITE are recommended both around threads and on mating surfaces.

For dimensions H_1 and Z see ch. 8, 10, 12 and 14.

Supplementary description when ordering by **designation**: **flange B5** or **flange B5 type B** (see table).



Flange B5 ● Flange B5 type B

● Position of the reference groove (see ch. 16) for radial load verification.

1) Bolts projecting 6 mm from dimension X_1.

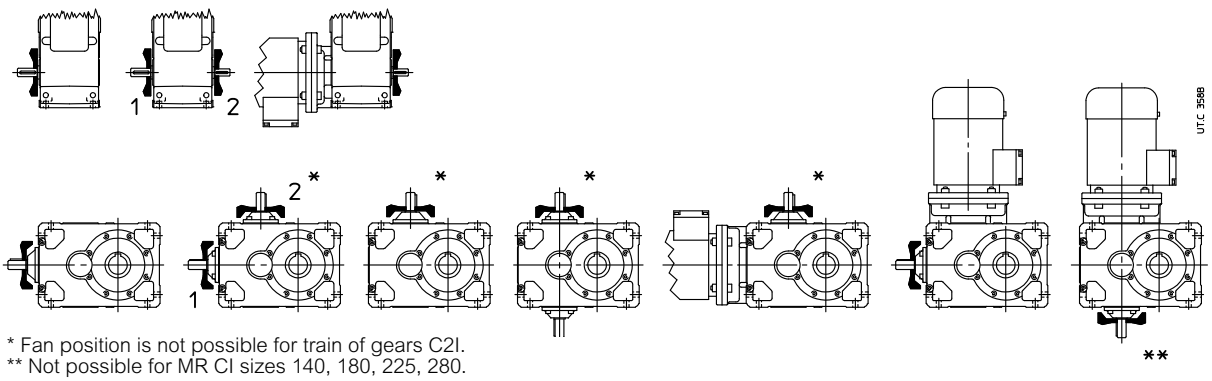
With double extension high speed shaft designs both extensions are **accessible** even with fan fitted: personnel safety-guards are the Buyer's responsibility (2006/42/EC).

Designs and positions are as shown below.



* Fan position is not possible for train of gears C2I.
** Not possible for MR CI sizes 140, 180, 225, 280.

Temperature of cooling air must not exceed ambient temperature.

Supplementary description when ordering by **designation**: **fan cooling**; in design with double extension high speed shaft state if pos. **1** or **2** or – only for helical gear units – **1** and **2**.

Also available independent cooling unit with heat exchanger (see h. 17 (30)); consult us, if need be.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(16) Water cooling by coil (sizes 125 ... 360)

Gear reducers and gearmotors sizes 125 ... 360, excluding ICI train of gears and mounting positions V... with groove side towards the bottom, can be supplied with copper alloy coil for water cooling.

On request, available also stainless steel coil (AISI 316) or cupro-nickel; consult us.

Cooling water specifications:

– be not too hard ⩽ 12 °F (French degrees) ;
– max temperature 68 °F (20 °C);
– capacity 2.6 - 5.2 gal/min;
– pressure 29 - 58 psi (2 - 4 bar).

A smooth metallic pipe (with external diameter **d** stated on table) is sufficient for the connection.

The load loss in the coil, according to the water flow and pressure, is of 9 - 12 psi for diameter Ø d16 and 12 - 15 bar for diameter Ød 12.

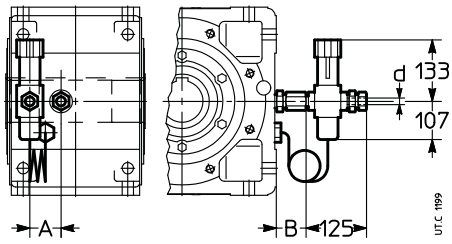
On request **thermostatic valve** which, automatically and without auxiliary supply need, permits water circulation when gear reducer oil reaches the set temperature; the valve sensor is equipped with immersion bulb. Mounting and setting, adjustable within 122 - 194 °F (50 ÷ 90 °C), are Buyer's responsibility.

For ambient temperature lower than 32 °F (0 °C) consult us.

Supplementary description when ordering by **designation: water cooling by coil** or **water cooling by coil and thermostatic valve.**

Size	**A**[1] ≈	**B**[1] ≈	**d** Ø	*Ts*[2] lb in
125 ... 180	40	40	10	265
200 ... 280	50	40	12	265
320 ... 360	60	45	16	305

1) Values valid for B3 mounting position and U ... A design. For other mounting positions and/or designs: consult us.
2) Tightening torque.

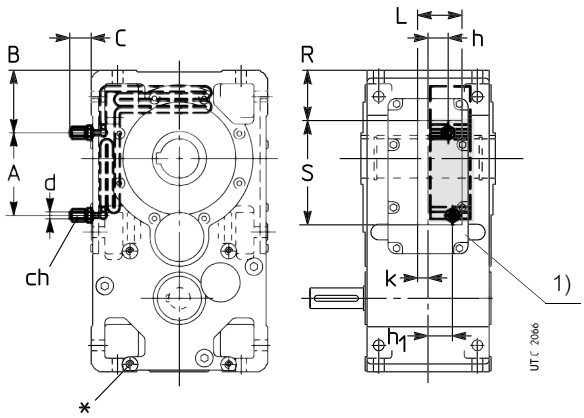


(17) Cooling by internal exchanger (sizes 140 ... 360)

The following gear reducers and gearmotors:

– sizes 140 ... 360;
– helical gear units 2I, 3I;
– bevel helical C2I, design UO2A, ...H, ...V, ...R (excluding the relevant versions sin);

can be equipped with **internal** and **extractable** heat exchanger, made of aluminium, finned, mounted on gear reducer inspection cover (facilitating the maintenance operations) for the water cooling of lubrication oil.



Internal heat exchanger, on gear reducer inspection cover

1) Free area for pipe fastening and coil fastening devices.

In case of MR gearmotors mounting positions UO2V ... UO2H the heat exchanger may not be fully extractable.

360	2	2.24	2.12	60	255	34	30	16	66	66	2	129	177	302

Cooling water specifications:

– be not too hard ⩽ 12° F (French degrees);

– max temperature max 68 °F (20 °C);

– capacity 2.6 - 5.2 gal/min;

– pressure 29 - 58 psi (2 ÷ 4 bar).

A smooth metallic pipe (with external diameter **d** stated on table) is sufficient for the connection, paying attention to keep fixed the fillet using a second hexagon wrench, when fastening the pipe on the fillet.

The load loss in the internal exchanger, according to the water flow and pressure, is of 20 ÷ 26 psi for diameter Ød 16 and 26 ÷ 29 psi for Ød 12.

On request **thermostatic valve** which, automatically and without auxiliary supply need, permits water circulation when gear reducer oil reaches the set temperature (after technical feasibility verification, consult us); the valve sensor is equipped with immersion bulb. Mounting and setting, adjustable within 122 - 194 °F (50 ÷ 90 °C), are Buyer's responsibility.

For ambient temperature lower than 32 °F (0 °C) consult us.

Supplementary description when ordering by **designation**: **independent cooling with internal exchanger**.

(18) Additional oversized housing hole for cooling oil pipe (sizes 160 ... 360)

In the event of oil cooling system through centralized external circuit (e.g.: paper plants) it is necessary to foresee an additional hole of proper dimensions on gear reducer housing in order to allow the lubricant flow for gravity.

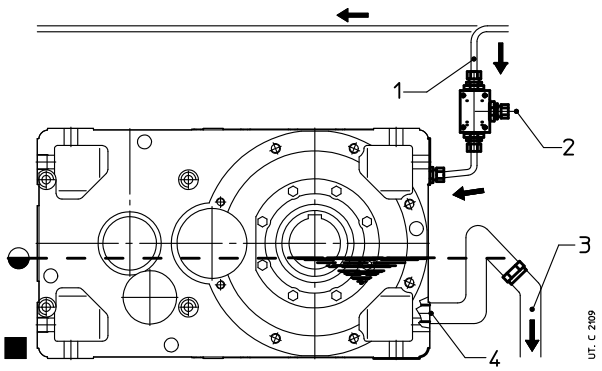
The setting of oil flow at gear reducer input must be executed by the Customer during the installation.

The heat quantity dissipated by the system depends on oil flow and on input and output oil temperature difference.

Available only for mounting positions B3 and B8 and sizes 160 ... 360.

Threaded hole **G 2"** for sizes 160 ... 225 and **G 2 1/2"** for sizes 250 ... 360.

Supplementary description when ordering by **designation**: **additional oversized housing hole**.



Legend:

2 Flow rate fine tuning value
3 Oil drain, towards centralized cooling tank
4 Additional oversized diameter housing hole

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(19) Bearing lubrication pump (sizes 100 ... 360)

Piston pump (driven by a cam from the low speed shaft) or **high speed shaft lubrication device** (only R 2I size 100 ... 280 and mounting position V5), for non oil-bath bearing lubrication.

In the following table the cases are stated where for input speed included in the range n_1 = **1 400 - 1 800** rpm it is necessary to foresee the bearing lubrication pump or the high speed shaft lubrication device (see also 🛢 at ch. 8, 10, 12, 14). For other speed values, consult us.

In general, when the maximum system reliability is required, in presence of particularly heavy duty cycles or sever ambient conditions, it is necessary to evaluate the possibility to install a bearing lubrication pump; consult us.

Supplementary description when ordering by **designation: bearings lubrication pump or high speed shaft lubrication device.**

Train of gears	Mounting position	Presence of lubrication pump or lubrication device n_1 = **1 400 - 1 800** rpm Gear reducer size					
		100	**125**	**140 ... 180**	**200, 225**	**250, 280**	**320 ... 360**

MR C2I	**B3, B6 with 🛢**	-	-	P	P	P	P

– = Bearing lubrication pump and high speed shaft lubrication device not necessary.
D = Lubrication device.
P = Lubrication pump.
1) Consult us.
2) Lubrication pump on request.

(20) Hollow low speed shaft washer (sizes 40 ... 360)

All gear reducers and gearmotors can be supplied with washer, retaining ring (excluding sizes 40 ... 63), bolt for axial fastening and protection cap (excluding input side of helical gear reducers and gearmotors sizes 40, 50 and gearmotors 3I 63), see ch. 18.

Supplementary description when ordering by **designation**: **hollow low speed shaft washer**.

(21) Hollow low speed shaft washer with locking rings or bushing (sizes 40 ... 360)

All gear reducers and gearmotors (excluding MR 3I 40 ... 63) can be supplied with washer, retaining ring (excluding sizes 40 ... 63), locking rings (sizes 40 ... 63) or locking bushing (sizes 64 ... 360), bolt for axial fastening and protection cap (excluding input side of helical gear reducers and gearmotors, sizes 40, 50), see ch. 18 «Hollow low speed shaft».

ATTENTION. In applications with **travelling lifts**, the locking bushing is not sufficient to assure a stable keying of hollow low speed shaft with machine shaft end, even if the axial fastening screw is fitted with locking adhesive. In these cases, it is necessary to have a keying with hollow shaft and **shrink disc**. This is valid, in general, also for a high frequency of starting and braking with motion reversal and when the inertia ratio J/J_0 is very high ($\geqslant 5$).

Supplementary description when ordering by **designation: hollow low speed shaft washer with locking rings or bushing.**

(22) Hollow low speed shaft protection cap (sizes 40 ... 360)

The gear reducers and gearmotors, sizes 40 ... 360, can be supplied with a protection cap of the hollow low speed shaft free area (see ch. 18 «Hollow low speed shaft»).

ATTENTION. The protection cannot be mounted:
– on input side of helical gear reducers and gearmotors sizes 40, 50 and gearmotors 3I 63;
– in presence of standard low speed shaft;
– on sizes 180 ... 360 not equipped with the necessary pre-arrangement (e.g.: assembly is not possible for «aftermarket» supplies).

The protection cannot be supplied in presence of:
– double seal on low speed shaft (sizes 63 ... 160);
– labyrinth seal and greaser;

Consult us, if need be.

Supplementary description when ordering by **designation: hollow low speed shaft with protection cap or cover.**

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(23) Design for agitators, aerators, fans (sizes 125 ... 360)

This design has been specifically developed for aerators, agitators, and fans with high bending moment values (as a rough guide ⩾ 0,4 · T_2).

In addition to the rigid and precise **single piece** housing, «symmetrical» **universal** mounting, **patented** keying system for motor sizes 200 ... 315 which offers easier assembly and disassembly and avoids fretting corrosion, taper roller bearings, the fundamental characteristics of this **compact, economic and reliable** design are:

– extended bearing housing to improve radial and axial load ratings (taper roller bearings) and to reduce overhungs;
– plentiful low speed shaft end diameter;
– double seals on the low speed shaft with chromium plated raceway;
– space between double seals packed with grease and top hat arrangement which acts as water splash guard for aerators and as slinger for fans;
– oil lubricated bearing on low speed shaft end side: oil-bath for lower position (V5), pump lubrication for upper position (V6) (price addition); additional stainless steel drain plug to facilitate complete **oil** drainage. All this ensures **total reliability** (gear pairs and bearings) during running and **minimum maintenance**;

V5

V6 🔥

V6 🔥

🔥) Bearing lubrication pump.

Options:

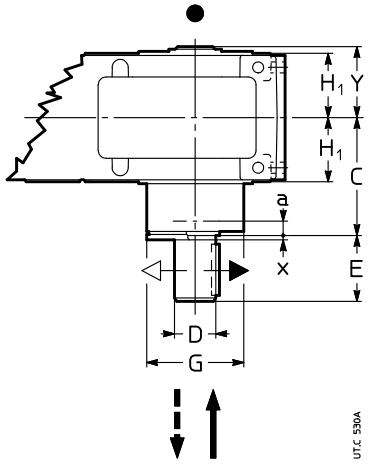
– drip proof cover for motor (standard protection IP 55);
– special paint;
– remote oil level and/or oil temperature indicator with threshold signal (sizes ⩾ 160).

Combinations **2** (direction of rotation – axial load direction) are to be preferred since they permit to withstand the highest of the two F_{a2} axial loads (see following table).

ICI and C3I trains of gears not possible; for CI and C2I, the ...sin designs are not possible.

Supplementary description when ordering by **designation**: **design for agitators**.

IMPORTANT. For selection of the gear reducer or gearmotor size and verification of radial and axial loads (and hence for the need of this design) **we always must be consulted: a detailed program of calculation** enables us to give a quick and reliable answer.



● Position of the reference groove (see ch.8, 10, 12, 14): useful for gear reducer design and mounting position identification on catalog.

Size	a 1)	C	D Ø m6	E	G Ø	x ≈ 2)	Y	Δm lb	F_{a2} ← ↓	F_{a2} ← ↑	F_{a2} → ↓	F_{a2} → ↑

(25) Heater (sizes 125 ... 360)

Oil heater for starting at low ambient temperature.
Specify the design «Oil temperature probe» together with this design.
The heater is piloted through proper control device (at customer's care e.g.: PLC or supplied by Rossi e.g. 2-threshold signalling device CT03 or three-threshold signalling device CT10) releasing when achieving the pre-set oil temperature.
IMPORTANT. The data stated in the table refer to **mounting positions B3** and **B8 only**; for other mounting positions, consult us.
The design can be not compatible with other designs (e.g. internal pump...), consult us.
Not possible for train of gears ICI and C3I.
Features:
– specific power 2.5 hp/ft$^{2;}$
– single phase supply 230 V 50-60 Hz or three-phase supply Δ 230 Y 400 V 50-60 Hz (see table);
– stainless steel resistors AISI 321;
– metallic terminal box; cable gland protection IP 65;
– horizontal mounting with oil bath lubrication;
– max oil temperature 194 °F (90 °C);
– threaded brass joint;
– available also in ATEX design; dimension and power values change, please consult us.
Supplementary description when ordering by **designation**: **oil heater**.

(26) High and low speed shafts seals (sizes 125 ... 360)

The seal types available (standard and on request) for sizes 125 ... 360 on low and high speed shaft, are stated in the following table; for size ⩽ 100, consult us.

Type of seal	Scheme
Standard	High speed shaft double seal Environment is quite dirty and/ or outdoor **Low speed shaft double seal** Environment is quite dirty and/ or outdoor	 Additional description when ordering by **designation**: **high speed shaft double seal.** **low speed shaft double seal**.
Labyrinth seal and high speed shaft greaser («taconite») Environment is very dirty (e.g.: mining industry)	 It may not be always available in the bevel helical design with fan. Please consult us. Additional description when ordering by **designation**: **labyrinth seal and high speed shaft greaser.**
Labyrinth seal with low speed shaft greaser («taconite») Environment is very dirty (e.g.: mining industry) 1)	 UT. C 2107 Note: for Z dimension see ch. 8, 10, 12 and 14. Additional description when ordering by **designation**: **labyrinth seal and low speed shaft greaser**.

Size	A	B Ø	C nr.1
125	5	138	M6
140	5	155	M6
160	6	178	M8
180	6	175	M8
200	8	195	M8

320, 321	9	310	M8
360	9	310	M8

1) The labyrinth disc overhangs from A dimension compared with shaft shoulder; the length of low speed shaft end is equal to E - A (for dimension E see ch. 17 (1) and (2)).

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Notes.

– The compound of seal rings is acrylonitrilic as standard; on request, seal rings with fluoro compound are available (e.g.: for high temperatures, for aggressive environments or for high rotation speed, etc.); specify in the designation: **seal with fluoro compound**.

– The **double seal of high speed shaft** is generally **to be avoided** as the bigger localized heating reduces the life of seal; for gearmotors the design can be supplied only on the eventual double extension high speed shaft; for gear reducers, the design can be supplied according to the following scheme.

Size	Double seal on high speed shaft											
	R I		**R 2I**		**R 3I**		**R CI**		**R ICI**		**R C2I**	
	shaft end		shaft end		shaft end		shaft end		shaft end		shaft end	
	normal	double ext.	normal	double ext.	normal	double ext.	normal	double ext.	normal	double ext.	normal	double ext.

180	–	–	●	●	●	●	●	●	–	●	●	●
200, 225	–	–	●	●	●	●	●	●	–	●	●	●
250, 280	–	–	●	●	●	●	●	●	–	–	●	●
320 ... 360	●	●	●	●	–	●	●	●	–	–	●	●

● Design possible
– Design not possible; consult us, if need be.

– In case of **double seal**, the external seal ring can be counter mounted (e.g. in presence of water jets); speficy in the designation: **external ring counter mounted**.

– The design **seal with labyrinth and high speed shaft greaser** can be supplied only after technical verification of feasibility by Rossi S.p.A.: consult us.

– The **hollow shaft with shrink disc** (see ch. 17 (6)) can be supplied with **labyrinth seal** only on **opposite side** to shrink disc; in this case foresee the «**hollow low speed shaft protection with shrink disc**» (see ch. 17 (7)); when this design is not available, consult us.

– For the additional description to the **designation** when ordering, see table on the previous page.

(27) Magnetic plug (sizes 125 ... 360)

In order to reduce lubricant contamination and to increase the maintenance interval and oil replacement, gear reducers and gearmotors size ⩾ 125 can be supplied with magnetic plug.

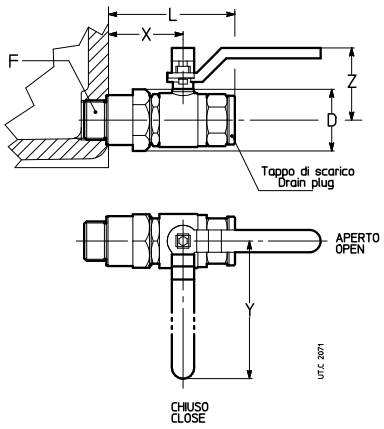
In presence of oil drain tap (28) the oil drain magnetic plug is mounted in a second drain hole on housing and not in the tap.

Additional description when ordering by **designation**: **oil drain magnetic plug**.

(28) Oil drain tap (sizes 125 ... 360)

The gear reducers and gearmotors size ⩾ 125 can be supplied with oil drain tap (accessory already assembled) in place of the drain plugs (see ch. 8, 10, 12, 14).

Additional description when ordering by **designation**: **oil drain tap**.



Size	F	D Ø	L ≈	X	Y	Z

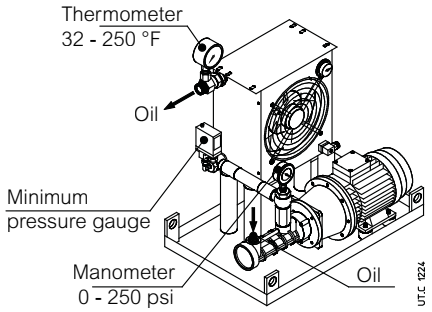
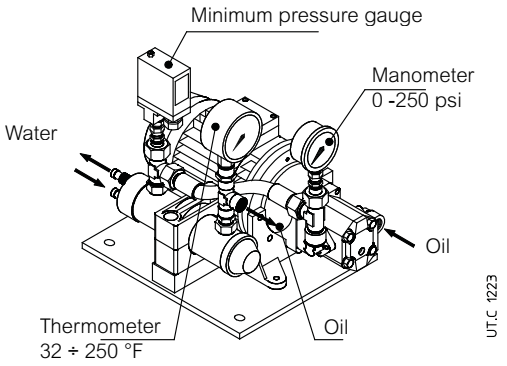
Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(29) Independent cooling unit



Oil/Air



Oil/Water

Additional cooling device in the event that the other forced cooling systems are not sufficient for the dissipation of thermal power produced by gear reducer during operation (see ch. 4).

Including:

– **oil/air heat exchanger** (O/A; with thermostat and adjustable control knob 32 - 194 °F (0 - 90 °C) or **oil/water heat exchanger** (O/W),
– **motor pump**: screw pump with fluoro rubber seals (gear pump for UR O/W 5hp ÷ UR O/W 28hp); 4 pole motor B3/B5 (three-phase Δ230 Y400 V 50 Hz); motor-pump connection with coupling;
– **motor fan** (O/A) (three-phase supply Δ230 Y400 V 50 Hz or single phase supply 230 V 50, 60 Hz, see next table)
– **analogic manometer** 0 - 250 psi (0 - 16 bar) mounted between pump and exchanger;
– **analogic thermometer** 32 - 250 °F (0 - 120 °C) mounted at exchanger output;
– **low pressure switch** (with on-off switch) mounted between pump and exchanger;
– **supporting frame** with nameplate.

On request, several accessories are at disposal (supplied separately, assembled by Customer) in order to satisfy all functionality and safety needs.

– **oil temperature probe Pt100**;
– **2-threshold signalling device CT03** (necessary also the oil temperature probe Pt100) for the mounting on rail to DIN EN 50022;
– **3-threshold signalling device CT10** (necessary also the oil temperature probe Pt100) for the mounting on rail to DIN EN 50022;
– **bi-metal type thermostat**;
– **flow gauge**;
– **filter** (with optical-eletric blockage warning and one or two filters M60)

Connections realized by flexible pipes (type SAE 100 R1, maximum length 2 m) between gear reducer and cooling unit and the assembly of accessories and signalling devices are Buyer's responsibility.

For the heat exchanger power required by the independent cooling unit:

$$\boldsymbol{P}_S \geqslant (\boldsymbol{P}_1 - \boldsymbol{Pt}_N \cdot \boldsymbol{ft}_1 \cdot \boldsymbol{ft}_2 \cdot \boldsymbol{ft}_3 \cdot \boldsymbol{ft}_4 \cdot \boldsymbol{ft}_5) \cdot (1 - \eta) \cdot \boldsymbol{K}_1$$

where:

P_S	nominal power of unit [hp], i.e. the power dissipable with hot oil at approx. 176 °F (80 °C) and cooling air at 104 °F (40 °C) (O/A) or cooling water at 20 °C (O/W) with stated capacity (see next table);
P_1	power at gear reducer input [hp] (consider the power installed when being uncertain about the power absorbed).
Pt_N	nominal thermal power of gear reducer [hp] (see ch. 4);
ft_1	thermal factor according to input speed (see ch. 4);
ft_2	thermal factor according to ambient temperature (see ch. 4);
ft_3	thermal factor according to mounting position (see ch. 4);
ft_4	thermal factor according to altitude (see ch. 4); for UR O/A derate also the exchanger power: multiply P_S by 0,85 (for 3 300 - 8 200 ft a.s.l.) or by 0.71 (for 8 200 - 16 400 ft a.s.l.);
ft_5	thermal factor according to air speed on the housing (see ch. 22);
η	gear reducer efficiency (see ch. 6);

K_1 = 1,18 takes into account the decrease of the exchanger efficiency due to dirt on the external surface.

Starting mode and required accessories

Ref.	Gear reducer lubrication system	Gear reducer starting mode	T_{amb} °F (°C)	Required accessories	Required oil type	Description and remarks
A1	Splash lubrication	Without oil pre-heating	32 – 77 (0 – 25)	Pt100 + CT10	Mineral oil or synthetic oil (preferable)	**Gear reducer starting and subsequent motor-pump starting with warm oil**. The motor-pump is managed by the **three-threshold** oil temperature control system (Pt100 + CT10). Set the three-threshold device CT10 with: – operating temperature 140 °F (60 °C) (starting of motor-pump); – restoring temperature 104 °F (40 °C); – warning temperature 194 °F (90° C).
A2	Splash lubrication	Without oil pre-heating	> 77 (> 25)	–	Polyalphaolefine based synthetic oil	**Simultaneous starting of gear reducer and motor-pump** Oil filter not possible[4].
B1	Forced lubrication (bearings and/or gears)	With oil pre-heating	32 – 77 (0 – 25)	Pt100 + CT03 Pt100 + CT10 Oil heater	Mineral oil or synthetic oil (preferable)	**Simultaneous starting of gear reducer and motor-pump after oil pre-heating**[3]. The oil heater is managed by the **two-threshold** oil temperature control system (Pt100 + CT03). The motor-pump and the gear reducer motor are managed by the **three-threshold** oil temperature control system (Pt100 + CT10). Set the two-threshold device CT03 with: – operating temperature 122 °F (50 °C) (oil heater disconnection); – restoring temperature 86 °F (30° C). Set the three-threshold device CT10 with: – operating temperature 104 °F (40 °C) (starting of motor-pump and gear reducer motor); – restoring temperature 50 °F (10 °C); – warning temperature 194 °F (90° C).
B2	Forced lubrication (bearings and/or gears)	Without oil pre-heating	> 77 (> 25)	–	Polyalphaolefine based synthetic oil	**Simultaneous starting of gear reducer and motor-pump**[3] Oil filter not possible[4].

1) Connection for delivery UR O/A 16.
2) Connection for delivery in case of filter.
3) It is advisable to delay the gear reducer motor starting by at least 1 min compared to the motor pump starting.
4) The oil filter requires that cooling unit is started with oil already warm: refer to case A1 or B1.

Additional description when ordering by **designation**:
independent oil-air cooling unit UR O/A ... or **independent oil-water cooling unit UR O/W ...** , possibly integrated, when required by the application, with description: «**Forced lubrication …**» and the statement of bearings and/or gear pairs to be lubricated. For dimensions, accessories and further technical details, see specific literature.

(30) Oil temperature probe (sizes 125 ... 360)

Remote oil temperature gauge; installation (at Buyer's responsibility) instead of an existing drain plug, or into a hole properly pre-arranged. The temperature gauge is realized with a thermo-resistor *Pt*100 having following features:

– platinum wire with 100 Ω at 32 °F (0 °C) according to EN 60751;
– precision class B according to EN 60751;
– operation temperature field -40 °F - +392 ° F (-40 °C - 200 °C);
– max current 3 mA;
– 3 wires connection according to IEC 751 (see fig. below);
– stainless steel probe AISI 316; diameter 6 mm;
– cable 1 m long with free end.

For the connection of probe to relevant signalling device CT03 or CT10 (on request, consult us) use a protected section cable ⩾ 1.5 mm^2 positioned separately from power cables.

In case of gear reducer supplied with oil and optional oil temperature probe, for the assembly of the same probe.

It is necessary to position the gear reducer so that the probe seating hole is upwards; if this is not possible, it is necessary to arrange a probe already equipped with a bulb pre-assembled in the factory, whose position has to be agreed in advance with Rossi; consult us.

Supplementary description when ordering by **designation**: **oil temperature probe**.

(31) Oil temperature probe with terminal box and amperometric transducer 4 - 20 mA (sizes 125 ... 360)

Remote oil temperature gauge, with terminal box and amperometric transducer; installation (at Buyer's responsibility) instead of drain plug. The temperature gauge is realized with a thermo-resistor Pt100 having following features:

– platinum wire with 100 Ω at 32 °F (0 °C) according to EN 60751;
– precision class B according to EN 60751;
– temperature range -40 °F - 392 °F (-40 °C - 200 °C);
– 3 wires connection according to IEC 751 (see fig. below);
– stainless steel probe AISI 316; diameter 6 mm;
– amperometric transducer with output signal 4 - 20 mA;
– alluminium terminal block (supplied without cable gland);
– protection IP65;
– input cables G ½".

For the connection of probe to relevant signalling device use a protected section cable ⩾ 1,5 mm^2 positioned separately from power cables.

ATTENTION. Accessory available only for technical feasibility evaluation by Rossi S.p.A.: consult us.

In case of gear reducer supplied with oil and optional oil temperature probe, for the assembly of the same probe.

It is necessary to position the gear reducer so that the probe seating hole is upwards; if this is not possible, it is necessary to arrange a probe already equipped with a bulb pre-assembled in the factory, whose position has to be agreed in advance with Rossi; consult us.

Supplementary description when ordering by **designation**: **oil temperature probe with therminal box and amperometric transducer**.

(32) Bearing temperature probe (sizes 125 ... 360)

Probe for the remote monitoring of bearing temperature; installation (at Buyer's responsibility) into a hole properly pre-arranged, next to a bearing to **be agreed during order phase** (for the most common cases, in order to facilitate the identification of bearing to be monitored, refer to following scheme).

The temperature gauge is realized with a thermo-resistor Pt100 having following features:

– platinum wire with 100 Ω at 32 °F (0 °C) according to EN 60751;
– precision class B according to EN 60751;
– temperature range -40 °F - +392 °F (-40 °C - 200 °C);
– max current 40 mA;
– 3 wire connection according to IEC 751 (see fig. below);
– stainless steel AISI 316 flat probe; diameter 6 mm;
– stainless steel sliding fillet.

Not available for ICI and C3I train of gears.

For gearmotors, positions A1 and A2 not available.

For the connection of probe to relevant signalling device CT03 or CT10 use a protected section cable ⩾ 1,5 mm² positioned separately from power cables.

Supplementary description when ordering by **designation**: **bearing temperature probe**.

(33) Bearing temperature probe with terminal box and amperometric transducer 4 - 20 mA (sizes 125 ... 360)

Probe for remote bearing temperature monitoring, with terminal box and amperometric transducer; installation (at Buyer's responsibility) in a threaded hole properly pre-arranged next to a bearing **to be agreed when ordering** (for the most common cases, in order to facilitate the identification of the bearing to be monitored, it is possible to refer to the scheme at (32)).

The temperature gauge is realized with a thermo-resistor Pt100 having following features:

– platinum wire with 100 Ω at 0 °C according to EN 60751;
– precision class B according to EN 60751;
– temperature range -40 °F - +392 °F (-40 °C - 200 °C);
– 3 wire connection according to IEC 751 (see fig. below);
– amperometric transducer with output signal 4 - 20 mA;
– alluminium terminal block (supplied without cable gland);
– protection IP65;
– input cables G ½";
– stainless steel AISI 316 flat probe; diameter 6 mm;
– stainless steel **sliding** fillet.

For the connection of probe to relevant signalling device use a protected section cable ⩾ 1,5 mm² positioned separately from power cables.

Not available for ICI and C3I train of gears.

For gearmotors, positions A1 and A2 not available.

Supplementary description when ordering by **designation**: bearing temperature probe with **amperometric transducer**.

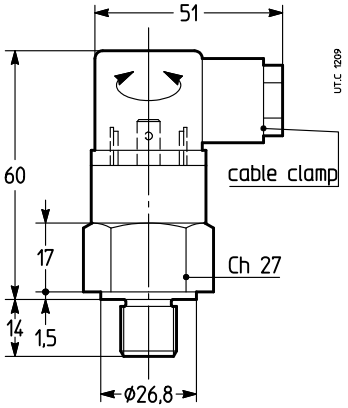
(34) Bi-metal type thermostat (sizes 100 ... 360)



Gear reducers and gearmotors sizes ⩾ 100 can be supplied with bimetal type thermostat for the control of the maximum admissible oil temperature.

Thermostat specifications:

– NC contact with maximum alternate current 10 A - 240 V d.c. (5 A - 24 V d.c.);
– G 1/2" thread connection;
– Pg 09 DIN 43650 cable gland;
– IP65 protection;
– Setting temperature 194 °F ± 9 °F (90 °C ± 5 °C) (other setting temperatures are possible, on request);
– Differential temperature 27 °F (15 °C).

Mounting into a threaded hole (position to be defined according to mounting position and mounting arrangement: consult us) and oil bath lubrication is Buyer's responsibility.

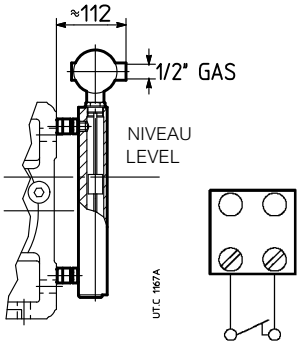
ATTENTION. Accessory available only for technical feasibility evaluation by Rossi S.p.A.: consult us.

Supplementary description when ordering by **designation**: **bimetal type thermostat**.

(35) Oil level switch with float (sizes 125 ... 360)

It is a level control device with reed contacts in a supporting stem moved by the magnetic field activated by the magnets included in the float.

The float and the supporting stem are included in a hollow column of not magnetic material connected to the gear reducer housing through communicating vessels.



Connecting features:

– 2 wires connection;
– maximum voltage: 350 V
– maximum current: 1.5 A
– 1 cable input 1/2" UNI 6125 – IP65
– G 1" brass joint.

The switch is supplied ready for use; when level goes down approx 5 mm, the switch goes on and contact opens.

When filling oil in the gear reducer it is necessary to verify that device is properly calibrated. If any problems occur during this operation contact Rossi.

ATTENTION. Accessory available only for technical feasibility evaluation by Rossi S.p.A.: consult us.

Supplementary description when ordering by **designation: oil level switch with float**

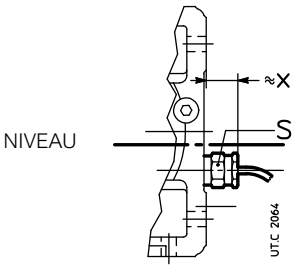
(36) Oil optical probe (sizes 125 ... 360)

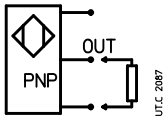
Optical scanner, without mobile parts, for the constant control of oil level, inside the gear reducer (at rest).

Features:

– stainless steel probe;
– operating temperature range -40 °F - +257 °F (-40 °C + 125 °C)
– d.c. supply 12 - 28 V (other types on request, consult us);
– PNP output (other types on request, consult us), max 100 mA;
– male coupling G 3/8", G 1/2", G 3/4", G 1" according to gear reducer size.

Supplementary description when ordering by **designation**: **oil optical probe.**





Size	S	x
125 ... 140	27	40

(37) Ex Gear reducer design ATEX II 2 GD and 3 GD (sizes 40 ... 360)

Helical and bevel helical gear reducers and gearmotors may be supplied according to Directive ATEX in order to be used in potentially explosive atmospheres – category **2 GD** (for operation in zones 1 (gas), 21 (dust): **probable** presence of explosive atmosphere) and **3 GD** (for operation in zones 2 (gas), 22 (dust): **improbable** presence of explosive atmosphere) – with surface temperature T 135 °C (T4).

These are the main variations of the product:

- fluoro-rubber seal rings;
- metal plugs; filler plug with filter and valve;
- special name plate with ATEX mark and indication of application limits;
- external protection based on a water-soluble dual-compound polyrethane **conductive** enamel, **color grey** RAL 7040, corrosivity class C3 ISO 12944-2;
- «ATEX instructions» manual.

For category **2 GD**[1)], depending on **minimum control intervals**, also:

2 GD monthly control

- double seal rings on low speed shaft;

2 GD quarterly control (sizes 125 ... 360):

- double seal rings on low speed shaft;
- oil temperature probe;
- possible bearing temperature probes.

This solution is advisable when the gear reducer has difficult access or when a decrease in control frequency is desired.

Temperature range: -4 °F - +104 °F (-20 - +40 °C); 32 °F - +104 °F (0 - +40 °C) for gear reducers supplied with bearing lubrication pump).

The «**ATEX instructions**» (with the additional documentation, if any) are **integral part of the supply of each gear reducer**; every indication stated in it must be carefully applied. Consult us if need be.

Attention. In the following cases ATEX design of gear reducer is incompatible with accessories and non-standard designs:

Accessory or non-standard design	Gear reducer ATEX II design	
	2 GD	**3 GD**
Hollow low speed shaft with shrink disc (6)	●	●
Optional paint according to cycles 3H..., 2I..., 2L... (24)	○	○
Heater (25)	○	○
Labyrinth seal and greaser (26)	●	●
Independent cooling unit (29)	–	–
Oil temperature probes (30) (31)	○	○
Bearing temperature probes (32) (33)	○	○
Bi-metal type thermostat (34)	–	–
Oil level switch with float (35)	2)	●
NEMA C-Face adapter (38)	●	●
Hollow low speed shaft protection (20) (22) for sizes 63 ... 160	–	–

– Not available.
● Available.
○ Available but in ATEX design suitable for gear reducer's ATEX design and for use purpose and area.
1) The presence of bearing lubrication pump requires one or more additional bearing temperature probes.
2) This accessory is available for category 2 G (zone 1) only.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Gear reducer size selection

Determine the size of gear reducer as indicated in ch. 5 considering following additional indications:

- **maximum input speed** $n_1 \leq$ **1 500 rpm**; for other input speed, consult us.
- **service factor required** determined as per ch. 3, increased by table correction factor fs_{ATEX} (see table 1) and anyway **never lower than 1**; inpresence of a hollow shaft with shrink disc (6) verify that maximim peak torque is always lower than T_{2SD} / $f_{S\,ATEX}$ (for T_{2SD} values see ch. 17(6)).
- thermal power Pt verified as per ch. 4 according to nominal thermal power Pt_N increased by thermal factors ft_1 [1] ... ft_4 and ft_{ATEX} corrective factor(see table 1).

Table 1 - Corrective factors for ATEX design of service factor required and of nominal thermal power

Category	fs_{ATEX}	ft_{ATEX}
2 GD	1,.8	0.8 (0.71 for I and CI)
3 GD	1.06	0.9 (0.8 for I and CI)

1) When determining ft_1 consider a value of ft_{1a} (see page 28) **never exceeding 1**.

Supplementary description when ordering by **designation**[2]:

design ATEX II ...

... 3 GD T4	sizes 40 ... 360
... 2 GD T4 monthly control	sizes 40 ... 360
... 2 GD T4 quarterly control	sizes 125 ... 360

2) This designation, in case of gearmotor, refers to the gear reducer part only.

(38) NEMA C-Face adapter (IEC motor sizes 63 ... 225)

Accessory for the transformation of motor coupling dimensions, at gearmotor input, from IEC to NEMA C-Face; available for IEC-NEMA motor size combinations stated in the table; other combinations on request; consult us. Mounted on gear reducer.

For the **verification of maximum flange bending moment MR** (see ch. 6) it is necessary to add the value of Y2 [mm] to HF dimension (ch. 6) and include in the mass of motor NEMA [kg] the mass of adapter [kg].

Supplementary description when ordering by **designation**: **MPN ...** (see following page).

(39) Solid low speed shaft with inch diameter (sizes 100 ... 360)

Gear reducers and gearmotors sizes 100 ... 360 can be equipped with solid low speed shaft with inch diameter; shaft end can be on opposite to groove side, on groove side or on both (double extension).

For sizes 225, 280 and 360 radial loads (ch.16) are to be multiplied dy 0.4.

For the bore of parts keyed onto shaft end the D tolerance +0.0015 / -0.0000 is suggested (+0.0010 / -0.0000 for size 100) provided that the load is uniform or with moderate overloads and without reversals; otherwise an interference fit should be taken into account; consult us. Before mounting, clean carefully and lubricate mating surfaces against seizure and fretting corrosion.

Installing and removal operations should be carried out with pullers and jacking screws using the tapped hole at the shaft butt-end; for interference fits it is advisable that the part to be keyed is preheated to a temperature of 176 – 212 °F (80 – 100 °C).

(40) Hollow low speed shaft with inch diameter (sizes 40 ... 225)

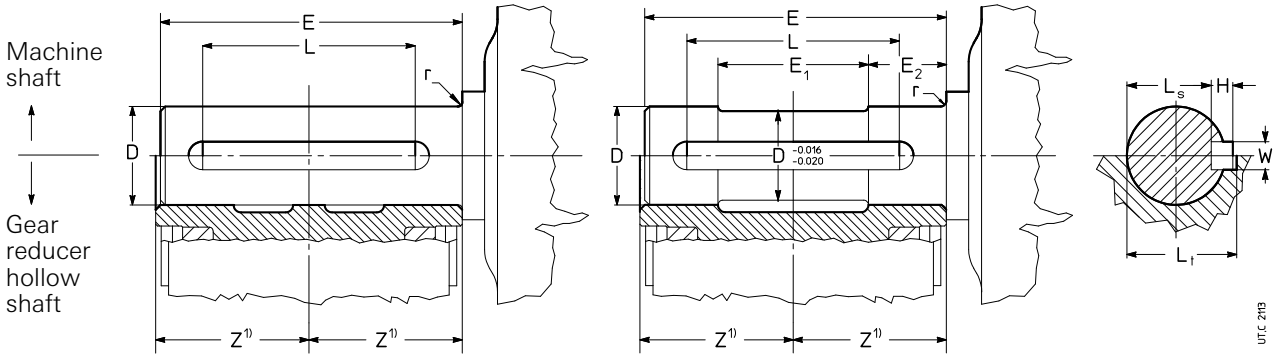
Gear reducers and gearmotors sizes 40 ... 225 can be equipped with hollow low speed shaft with inch diameter; unlike the standard hollow low speed shaft the retaining ring grooves are not present with this design.

«Hollow low speed shaft washer» and «Hollow low speed shaft washer with locking rings or bushing» (ch. (20) and (21)) not available.

Dimensions of machine shaft end on which the gear reducer hollow shaft is to be keyed are those recommended in the table and shown in the figures below.

The suggested machine shaft D tolerance is valid for uniform load or moderate overloads without load reversals; otherwise a different fit should be taken into account; consult us.

Important: the shoulder diameter of the driven machine shaft end abutting with the gear reducer must be at least (1.18 – 1.25) D.



sizes **40 ... 63** sizes **64 ... 225**

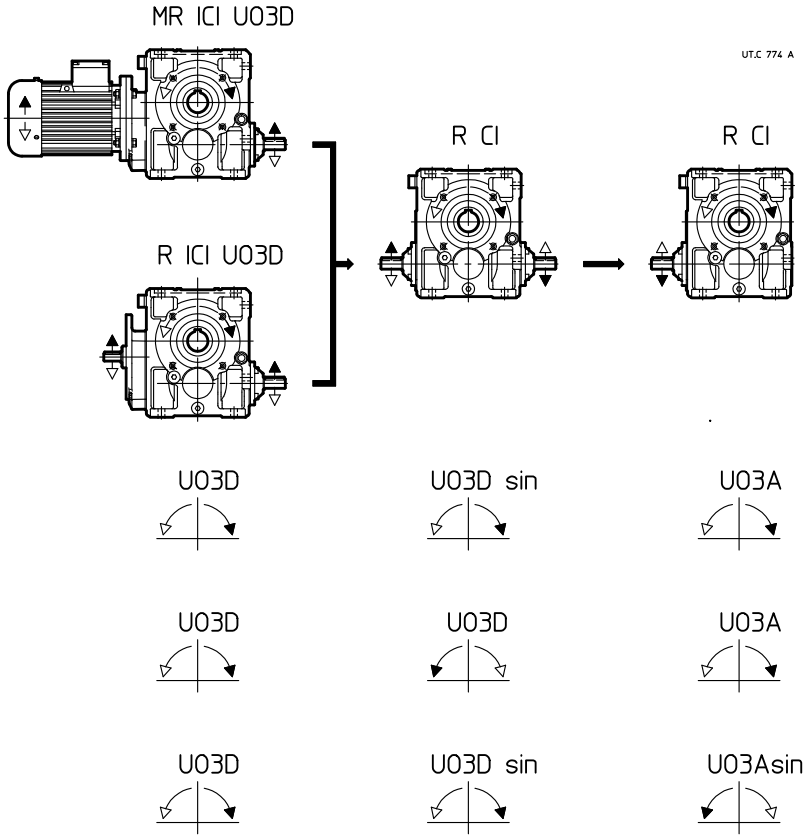
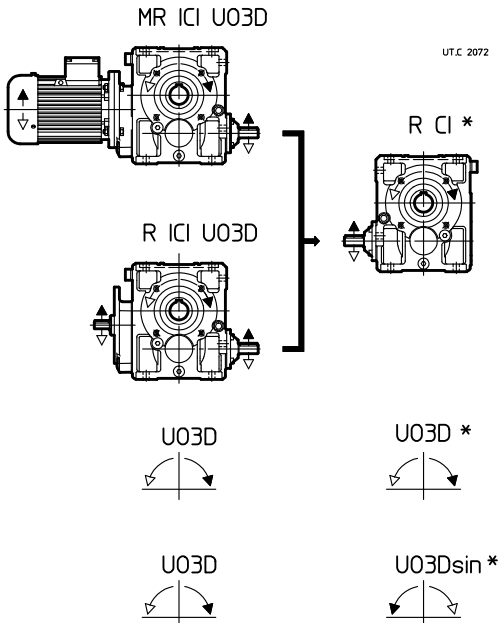
Miscellaneous

– Synchronous multiple drives:
gear reducers and gearmotors with trains of gears ICI sizes 50 ... 100 can be applied for multiple drives together with same size gear reducers, all having the same transmission ratio (see also ch. 10);



On request, gear reducers R CI can be supplied also for sizes 125 ... 200. In this case, after defining the size and the initial gear reducer or gearmotor transmission ratio ICI, the gear reducers R CI must be selected with this same size and transmission ratio resulting from the one of the initial gear reducer divided by the transmission ratio of the first helical reduction stage; the performance keep the same of initial ICI gear reducer or gearmotor.



* Gear reducers R ICI ... with design UO3 ... without helical first reduction stage

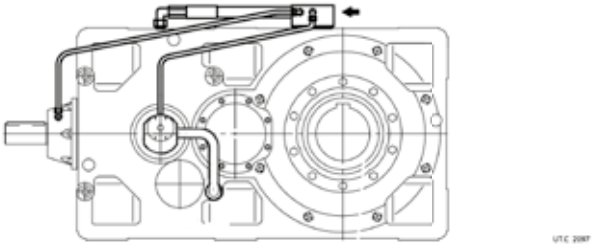
– Designs (direction of rotation), dimensions and mounting positions of gear reducers R CI 125 ... 200 U03A ... UO3Esin can be deducted from the ones of the similar gear reducers R ICI (see ch. 10).
– If necessary, consult us.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

– Gearmotors with:
  – **brake motor** (also single phase) with d.c. **safety and/or parking brake** (sizes 63 ... 132) with overall dimensions almost equal to the ones of standard motor and braking torque $T_{brake} \geqslant T_N$, maximum cost-effectiveness;
  – **two speed motor** (standard, brake, brake with safety and/or parking brake, with flywheel) with 2.4, 2.6, 2.8, 2.12, 4.6, 4.8, 6.8 poles;
  – motor featuring: d.c. supply; single-phase; explosion-proof; with second shaft end; with special protection, voltage and frequency; provided with devices against overloads and overheating;
  – **motor without fan** with external cooling **by natural convection** (sizes 63 ... 112); design usually realized for textile environment;
  – **motor for roller tables** with cooling fins by natural convection, no plastic parts, electromagnetic sizing and specific insulation system for drive with inverter and nominal torque constant on all frequency range;

  – Design with **2**[a] **motorization** with identical speed (**same** or different direction of rotation) or **reduced** (same direction of rotation, free-wheel coupling) (see picture); for sizes 320 ... 360 the 2nd motorization is realized with bevel helical gearmotor connected with bevel wheel shaft end;

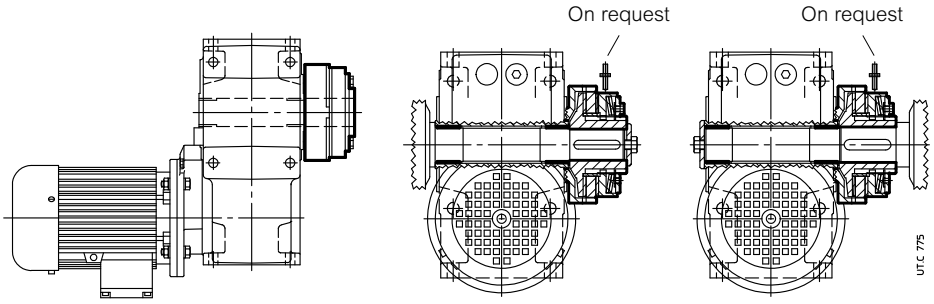
– Housing with B14 flange **on two faces** (train of gears 2I, 3I and 4I sizes 63 ... 125 model 2);
– Input centering (h8) for R CI, R C2I;
– Long model gearmotors sizes **250 ... 360**;
– Gearmotors with interposed compact clutch-brake or fluid coupling/ brake unit;
– Fitting with key, bronze bushing and shrink disc of CI, C2I trains of gears or motor size ⩽ 200;
– Semi-flexible and hydrodynamic couplings;
– Design for MR 2I with **through** low speed shaft;
– **Direct driven pump for forced lubrication of bearings and/or oil cooling by heat exchanger**.



– Gear reducers (excluding R I) and gearmotors with output **mechanical torque limiter** on gear reducer sizes **50 ... 125** (excluding sizes 64, 81).Gear reducer design with mechanical friction type torque limiter (friction surfaces without asbestos), compact, with high transmissible torque – up to **14 160** lb in – and top quality standards.
  It protects the drive from accidental overloads by excluding the effect of inertia loads transmitted from up-line masses and (the torque limiter being mounted on the output shaft) inertia loads transmitted from down-line masses.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

The system also permits **shaft mounting** with the limiter mounted **externally** (easily accessible), or in the **intermediate** position (better safety protection).
On request slide detector. For more details see **specific literature**.



External limiter mounting

Intermediate limiter mounting

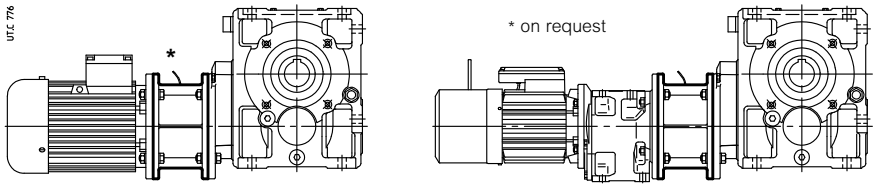
– **MLA unit, mechanical torque limiter on input shaft**, motor sizes **80 ... 200**.

Mechanical torque limiter unit to be interposed between gear reducer and B5 mounting position motor standardized to IEC (or wide belt or planetary motor-variator) or, in combined units, between the initial coaxial gear reducer and the final gear reducer sizes **63 ... 280**.

Axially ultra-compact design: excellent load bearing with life lubricated double row angular contact ball bearings (motor size < 112) or «O» disposed taper roller bearings.

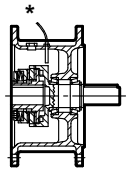
The unit protects the drive from accidental overloads by excluding inertia loads transmitted from up-line masses and down-line masses.

Module **MLA unit is friction type** (friction surfaces without asbestos). When the transmitted torque tends to exceed the setting, the drive «slips» although it remains engaged and transmits torque equal to the limiter setting value; slipping stops as soon as the load returns to normal; in the case of very brief overloads the driven machine will continue normal operation (after decelerating or stopping) without requiring reset procedures.



MLA
mounted between gear reducer and motor or motor-variator

MLA
mounted onto combined units



MLA
friction

* on request

Special maintenance-free wearproof mechanical seal for MR 2I, 3I size ⩾ 160, for one direction of rotation only (patented).

Driving group complete of base - motor, coupling, brake if any, second drive for shaft - mounting arrangements (see ch. 32).

18. Installation and maintenance

Safety

IMPORTANT: gear reducers and gearmotors supplied by Rossi are **components** to be incorporated into machinery and **should not be commissioned before the machinery in which the components have been incorporated conforms to:**

– Machinery directive 2006/42/EC and subsequent updatings; in particular, possible safety guards for shaft ends not being used for eventually accessible fan cover passages (or other) are the Buyer's responsibility;

– «Electromagnetic compatibility (EMC)» 2004/108/EC and subsequent updatings.

Attention! It is recommended to pay attention to all instructions of present catalog, all standards concerning correct installation and all existing safety laws. Whenever personal injury or property damage may occur, foresee adequate supplementary protection devices against:

– release or breakage of fastening screws;

– rotation or unthreading of the gear reducer from shaft end of driven machine following to accidental breakage of the reaction arrangement;

– accidental breakage of shaft end of driven machine.

If deviations from normal operation occur (temperature increase, unusual noise, etc.) immediately switch off the machine.

Installation

An incorrect installation, an improper use, the removing or disconnection of protection devices, the lack of inspections and maintenance, improper connections may cause severe personal injury or property damage. Therefore the component must be moved, installed, commissioned, handled, controlled, serviced and re-paired **exclusively by responsible qualified personnel specifically instructed** and have the experience necessary to **recognize** and prevent **dangers** connected to present products avoiding all possibile emergencies.

Gear reducers and gearmotors of present handbook are normally suitable for installations in **industrial areas**: **additional protection** measures, if necessary, must be adopted and assured by the personnel responsible for the installation.

Attention! Components in non-standard design or with special executions or with constructive variations may differ in the details from the ones described here following and may require additional information.

Attention! For the installation, use and maintenance of the **electric motor** or of the eventual motor variator and/or electric supply device (frequency converter, soft-start etc.), and/or optional electric devices (e.g.: independent cooling unit, etc.), consult the attached specific documentation. If necessary, require it.

Maintenance

When operating on gear reducer or on components connected to it the **machine** must be **at rest**: disconnect motor (including auxiliary equipments) from power supply, gear reducer from load, be sure that safety systems are on against any accidental starting and, if necessary, pre-arrange mechanical locking devices (to be removed before commissioning).

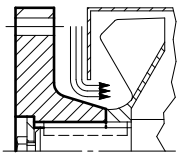
Attention! During the running the gear reducers could have **hot surfaces**; always wait that the gear reducer or the gearmotor to cool before carrying out any operations.

Please download further technical documentation from our website www.rossi.com.

Generals

Be sure that the structure on which gear reducer or gearmotor is fitted is plane, levelled and sufficiently dimensioned in order to assure fitting stability and vibration absence, keeping in mind all transmitted forces due to the masses, to the torque, to the radial and axial loads.

Position the gear reducer or gearmotor so as to allow a free passage of air for cooling both gear reducer and motor (especially at gear reducer and motor fan sides).



If there is fan on the gear reducer verify that there is sufficient space allowing an adequate circulation of cooling air also after fitting coupling protection. If a coupling protection is fitted, smooth the coupling hub, if necessary.

Avoid: any obstruction to the air-flow; heat sources near the gear reducer that might affect the temperature of cooling-air and of gear reducer for radiation; insufficient air recycle or any other factor hindering the steady dissipation of heat.

Mount the gear reducer so as not to receive vibrations.

When external loads are present use pins or locking blocks, if necessary.

When fitting gear reducer and machine and/or gear reducer and eventual flange **B5** it is recommended to use **locking adhesives** such as LOCTITE on the fastening screws (also on flange mating surfaces).

For outdoor installation or in a hostile environment protect the gear reducer or gearmotor with anticorrosion paint. Added protection may be afforded by water-repellent grease (especially around the rotary seating of seal rings and the accessible zones of shaft end).

Gear reducers and gearmotors should be protected wherever possible, and by whatever appropriate means, from solar radiation and extremes of weather; weather protection **becomes essential** when high or low speed shafts are vertically disposed, or where the motor is installed vertical with fan uppermost.

For ambient temperatures greater than 104 °F (40 °C) or less than 32 °F (0 °C), consult us.

Before wiring-up the gearmotor, make sure that motor voltage corresponds to input voltage. If direction of rotation is not as desired, invert two phases at the terminals.

Star-delta starting should be adopted for starting on no load (or with a very small load) and/or when the necessity is for smooth starts, low starting current and limited stresses.

If overloads are imposed for long periods or if shocks or danger of jamming are envisaged, then motor-protection, electronic torque limiters, fluid couplings, safety couplings, control units or other similar devices should be fitted.

Usually protect the motor with a thermal cut-out; however, where duty cycles involve a high number of on-load starts, it is necessary to utilise thermal probes for motor protection (fitted on the wiring); thermal cut-out is unsuitable since its threshold must be set higher than the motor nominal current of rating.

Connect thermal probes, if any, to auxiliary safety circuits.

Use varistors to limit voltage peaks due to contactors.

Attention! Bearing life, good shaft and coupling running depend on alignment precision between the shafts. Carefully align the gear reducer with the motor and the driven machine (with the aid of shims if need be), interposing flexible couplings whenever possible.

Whenever a leakage of lubricant could cause heavy damages, increase the frequency of inspections and/or envisage appropriate control devices (e.g.: remote oil level gauge, lubricant for food industry, etc.).

In polluting surroundings, take suitable precautions against lubricant contamination through seal rings or other.

Gear reducer or gearmotor should not be put into service before it has been incorporated on a machine which is conform to 2006/42/EC directive.

For brake or special motors, consult us for specific information.

Shaft end of driven machine

Dimensions of shaft end on which the gear reducer hollow shaft is to be keyed are those recommended in the table and shown in the figures below.

Sizes 40, 63: fitting with key (fig. a) or fitting with key and locking rings (fig. b).

Sizes 64 ... 360: fitting with key (fig. c) or fitting with key and locking bushing (fig. d); see also ch. 19 and 20; see also ch. 17.

In the case of cylindrical shaft end with only diameter D (fig. a, c), for the seat D on input side, we recommend tolerance h6, j6 (size < 225) or g6, h6 (size ⩾ 250) to facilitate mounting.

Important: the shoulder diameter of the driven machine shaft end abutting with the gear reducer must be at least (1.18 - 1.25) D.

40 ... 63 **64 ... 360**

360	180	160	506	–	272	137	43	400	72	–	14	5

1) Keyway depth not to standard (see ch. 6 «Hollow low speed shaft» table, dimension t).

2) In presence of «Labyrinth seal and low speed shaft grease» (ch. 17 (26)), it is necessary to increase the E dimension (E_2) by A quantity stated in the table on ch. 17 (26).

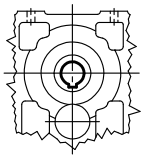
Fitting of components to shaft end

It is recommended that the holes of parts keyed onto shaft ends should be machined to H7 tolerance; for high speed shaft ends having D ⩾ 55 mm, tolerance G7 is permissible provided that the load is uniform and light; for low speed shaft end, tolerance must be K7 if load is not uniform and light. Other data according to table «High and low speed shaft end» (ch. 6). Before mounting, clean carefully and lubricate mating surfaces against seizure and fretting corrosion.

Installing and removal operations should be carried out with **pullers** and **jacking screws** using the tapped hole at the shaft butt-end; for H7/m6 and K7/j6 fits it is advisable that the part to be keyed is preheated to a temperature of 176 - 212 °F (80 - 100 °C).

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Hollow low speed shaft



In order to remove the hollow low speed shaft (this is the first operation to perform when disassembling the gear reducer) turn the shaft until the keyway is facing the intermediate shaft, as shown in the drawing alongside, and push the shaft from the reference groove side (see ch. 6).

For the shaft end of machines where the gear reducer stepped hollow shaft is to be keyed, h6, j6 or k6 tolerances are recommended according to requirements. Other details are given under «High and low speed shaft end (ch. 6)» and «Shaft end of driven machine» (ch. 18).

In order to have an easier **installing and removing** of gear reducers sizes 64 ... 360 with retaining ring groove proceed as per the drawings a, b, respectively (excluding MR 3I 100 with motor size 112 and 3I 125 with motor size 132; consult us).

For MR 3I 64 ... 81 first insert the washer with screw and the retaining ring into gear reducer hollow shaft (on motor opposite side); then mount on machine shaft end.

For the axial fastening it is possible to adopt the system as per fig. c, d. For sizes 64 ... 360, when shaft end of driven machine has no shoulder, a spacer may be located between the retaining ring and the shaft end itself (as in the lower half of the fig. d).

The use of **locking rings** (sizes 40 ... 63, fig. e), or of **locking bushing** (sizes 64 ... 360, fig. f) will permit easier and more accurate installing and removing and to eliminate backlash between key and keyway, friction system **complying** with Atex.

The locking rings or the locking bushing should be inserted after mounting (for MR 3I 64 ... 81 insert the bushing onto machine shaft end or into hollow shaft before mounting; pay attention when positioning the keyway); the shaft end of driven machine must be as prescribed at the previous page (or at ch. 17(6)) with stepped hollow low speed shaft or with shrink disc). Do not use molybdenum disulphide or equivalent lubricant for the lubrication of the parts in contact. **When tightening the bolt**, we recommend the use of a **locking adhesive** LOCTITE 601. For **vertical ceiling-type** mounting consult us.

In case of axial fastening with locking rings or bushing – especially when having heavy duty cycles, with frequent reversals – verify, after some hours of running, the bolt tightening torque and eventually apply the locking adhesive again.

A **washer** for gear reducer installing, removing (excluding sizes 40 ... 63) and gear reducer axial fastening with or without **locking rings or bushing** (dimensions stated in table) and hollow low speed shaft **protection cap** can be supplied on request. Parts in contact with retaining ring, if any, must have sharp edges.

Whenever personal injury or property damage may occur, **foresee adequate supplementary protection devices** against:

– rotation or unthreading of the gear reducer from shaft end of driven machine following to accidental breakage of the reaction arrangement;

– accidental breakage of shaft end of driven machine.

Size	63	64	80	81	100	125	140	160
s_{max}	2	3	6	6	7	9	9	11

For sizes 63 ... 160, the hollow low speed shaft protection cap must be keyed into seal ring seat that, for this reason, must be pushed towards gear reducer inside for the maximum depth stated in the table.

For this operation use the protection cap as a tool, hammering it carefully along the periphery (see fig. above). **For ATEX design gear reducers, this accessory is not available.**

1) Tightening torque for locking rings or bushing.
2) UNI 5931-84. For MR 3I: M 8 × 35 and M 10 × 40 UNI 5737-88.
3) For locking bushing: M 10 × 35, M 12 × 45, M 14 × 45, class 10.9; M 20 × 65, M 24 × 80 and M 30 × 100 UNI 5737-88 class 10.9; M 36 × 120 UNI 5931-84 class 10.9.
4) Locking bushing is not possible for MR 3I.
5) It cannot be used for the disassembly of MR 3I.

Lubrication

Gear pairs are oil-bath lubricated with the exception of the first reduction stage in helical gear reducers train of gears **3I** and the first two reduction stages of gearmotors **4I** sizes ⩽ 125 in V5 mounting position, which are lubricated «for life» with grease (SHELL Gadus S5). Bearings are either oil-bathed or splashed with the exception of the top bearings which are lubricated with a pump (see ch. 17(19)) or lubricated «**for life**» with grease (with or without NILOS ring according to speed).

Sizes 40 ... 81

The gear reducers are supplied **filled with synthetic oil** (KLÜBER Klübersynth GH 6-220, MOBIL Glygoyle 220, SHELL Omala S4 WE 220), providing lubrication – assuming pollution-free surroundings – «**for life**». Ambient temperature 32 - 104 °F (0 ÷ 40 °C) with peaks up to -4 °F (-20 °C) and +122 °F (+50 °C).

Important: verify mounting position keeping in mind that if gear reducer is installed in a mounting position differing from the one stated on name plate, it could need the addition – through the proper hole – of the difference between the two lubricant quantities as shown in ch. 8, 10, 12 and 14.

Sizes 100 ... 360

The gear reducers are supplied **without oil**; before putting into service, fill to the specified level[1], with **mineral oil** with **EP** (extreme pressure) **additives**, having the ISO viscosity grade given in the table. Under normal conditions the first speed range is for train of gears **I**, the second is for trains of gears **2I** and **CI**, the third is for trains of gears **3I**, **4I**, **C2I**, **ICI** and **C3I**, while the fourth is for **combined units**.

When it is required to increase oil change interval («long life»), the ambient temperature range and/or reduce oil temperature, use PAO polyalphaolefine based **synthetic oil** with **EP** (extreme pressure) **additives**, having ISO viscosity grade as indicated in the table.

1) Lubricant quantities stated on ch. 8, 10, 12, 14 are approximate for provisioning. The exact oil quantity the gear reducer is to be filled with is definitely given by the level.

ISO viscosity grade
Mean kinematic viscosity [cSt] at 104 °F (40 °C).

Speed n_2 min^{-1}	Ambient temperature[1] [°C] mineral oil 32 - 68 °F (0 - 20 °C)	mineral oil 50 - 104 °F (10 - 40 °C)	synthetic oil 32 - 104 °F (0 - 40 °C)
> **224**	150	150	150
224 ÷ 22.4	150	220	220
22.4 ÷ 5.6	220	320	320
< **5.6**	320	460	460

1) Peaks of 18 °F (10 °C); 36 °F (20 °C) for synthetic oil, below and 18 °F (10 °C) above the ambient temperature range are acceptable.

Oil types

Manufacturer	PAO synthetic oil ISO VG 150 ... 460	mineral oil ISO VG 150 ... 460
AGIP	Blasia SX	Blasia
ARAL	Degol PAS	Degol BG
BP	Enersyn EPX	Energol GR XP
CASTROL	Alphasyn EP	Alpha SP
FUCHS	Renolin Unisys CLP	Renolin CLP
KLÜBER	Klübersynth GEM4	Klüberoil GEM1
MOBIL	Mobil SHC Gear	Mobilgear 600 XP
SHELL	Omala S4 GX / S4 GXV	Omala S2 G / S2 GV
CHEVRON	Pinnacle	Meropa
TOTAL	Carter SH	Carter EP

For continuous duty, the use of synthetic oil is recommended in the following cases:
– R ICI, MR C3I 100, 125 and MR ICI 100 ... 200 mounting position B6;
– R I 100 with n_2 ⩾ 375 rpm;
– R CI 100 with n_2 ⩾ 150 rpm;
– R 2I and MR 2I 125 with i_N ⩽ 12.5, mounting position B7, n_1 ⩾ 950 rpm;
– MR ICI 200, motor size 225;

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

– gear reducers and gearmotors with size and mounting position marked with ✓ (see ch. 8, 10, 12, 14) and bevel helical gear reducers with double extension high speed shaft.

An overall guide to oil-change interval[2] is given in the table, and assumes pollution-free surroundings. When heavy overloads are present, halve the values.

Oil temperature °F	Oil temperature °C	Oil change interval [h] mineral oil	Oil change interval [h] synthetic oil
⩽ 149	⩽ 65	8 000	25 000
149 ÷ 176	65 ÷ 80	4 000	18 000
176 ÷ 203	80 ÷ 95	2 000	12 500
203 ÷ 230[1]	95 ÷ 110[1]	—	9 000

1) Values admissible for not continuous duty, only.
2) Values not valid for gear reducers according to ATEX directive; for values see ATEX instructions.

Apart from the running hours:
– replace the mineral oil at least each 3 years;
– replace or regenerate the synthetic oil at least each 5 - 8 years, according to gear reducer size, running and environmental conditions.

Never mix different makes of synthetic oil; if oil-change involves switching to a type different from that used previously, then give the gear reducer a thorough clean-out.

Combined gearmotor units

Lubrication remains independent, thus data relative to each single gear reducer hold good.

Seal rings

Duration depends on several factors such as dragging speed, temperature, ambient conditions, etc.; as a rough guide it can vary from 3150 to 25000 h.

Filler plug

For gear reducer sizes 100 ... 360, before unscrewing the filler plug with valve (symbol ⊸) wait until the unit has cooled and then open with caution.

Motor assembly and disassembly

Gearmotors with motor keyed onto hollow high speed shaft of gear reducer

Helical gearmotors MR 2I, MR 3I 140 ... 360
Bevel helical gearmotors MR CI, MR C2I

– be sure that the mating surfaces are machined under accuracy rating (IEC 60072-1);
– clean surfaces to be fitted thoroughly;
– check that the fit-tolerance (push-fit) between hole and shaft end is G7/j6 for D ⩽ 28 mm, F7/k6 for D ⩾ 38 mm;
– lubricate surfaces to be fitted against fretting corrosion;
– in the event of a lowered keyway, replace the motor key with the one supplied with the gear reducer; if necessary, check the key so that between its top and the bottom of the hole keyway there is a backlash of 0,1 - 0,2 mm; in case of output shaft keyway, lock the key by pins;

In presence of **hub clamp** (helical gearmotors 2I, 3I with motor sizes ⩾ 200) proceed as follows, for the mounting:
– Turn the hub clamp until the fastening screw head is aligned with one of the access holes on gear reducers flange, after having removed the relevant closure plugs;
– do not modify the axial position of the hub clamp supplied from workshop, as this position is the excellent one in order to achieve the maximum tightening effect;
– push the motor up to shoulder;
– tighten the motor fastening screws or nuts to gear reducer motor flange;
– complete the tightening with dynamometric wrench up to the tightening torque stated in the table; during this operation pay attention not to modify the axial position of hub clamp;
– screw again the closure plugs of access holes to gear reducer flange;

Gear reducer size 2I	Gear reducer size 3I	Screw UNI 5931	*T*s lb in
160 ... 225	**200 ... 280**	M12× 45 cl. 12.9	1 270
250... 360	**320 ... 360**	M12× 45 cl. 12.9 Ød ⩽ 75 M14× 50 cl. 8.8 Ød = 80	1 270 1 190

For the disassembly, proceed as follows:
– acting on motor shaft rear end, whenever possible, or disconnecting the gear reducer from machine and acting on gear reducer low speed shaft (with brake motor the brake must be released), align the wrench hole with the tightening screw of hub clamp;
– loosen the tightening screw and consequently the hub clamp (taking care not to modify the axial position of hub clamp);
– unscrew the motor fastening screws of nuts to gear reducer flange;
– disassemble the motor.

Gearmotors with helical pinion keyed directly on motor shaft end

Helical gearmotors MR 3I 40 ... 125, MR 4I
Bevel helical gearmotors MR ICI, MR C3I
Coaxial gearmotors, coupled with helical and bevel helical gear reducers (combined units).

– be sure that the mating surfaces are machined under accuracy rating (IEC 60072-1);
– clean surfaces to be fitted thoroughly;
– check that the fit-tolerance (push-fit) between hole and shaft end is K6/j6 for D ⩽ 28 mm, J6/k6 for D ⩾ 38 mm;

– in the event of a lowered keyway, replace the motor keyway with the one supplied with the gear reducer; adjust the keyway length to the motor shaft, if need be; check that between the top and the bottom of the hole keyway there is a backlash of 0.1 - 0.2 mm; in the event of output shaft keyway, lock the key by pins.
– make sure that the motors have bearing location and overhang (distance S) as shown in the table;

Motor size	Min dynamic load capacity lb		Max dimension 'S' in
	Front	Rear	
63	1000	750	0.63
71	1400	1060	0.71
80	2000	1500	0.79
90	3000	2240	0.89
100	4500	3350	0.98
112	5600	4250	1.1
132	8000	6000	1.32
160	10600	7500	1.48
180	14000	10000	1.57
200	18000	12500	1.77
225	22400	16000	1.87

– assemble on motor shaft, as follows:
– the **spacer** pre-heated at **149 °F** (65 °C) sealing the motor shaft part with **locking adhesive type LOXEAL 58-14** and ensuring that between keyway and motor shaft shoulder there is a ground cylindrical section of at least 1,5 mm; pay attention **not to damage the external surface** of spacer;
– the **key** in the keyway, taking care that a brief segment of at least 0,9 times the pinion width;
– the pinion pre-heated at **176 - 212 °F** (**80 – 100 °C**);
– the **axial fastening system** where foreseen (head self-locking screw with base, spacer, or hub clamp with one or more dowels, fig. a); for the cases foreseen **without axial fastening** (fig. b), seal with **locking adhesive type LOXEAL 58-14** also the motor shaft section below the **pinion**;
– in the event of axial fastening system with hub clamp and dowels, be sure that these ones do not overhang from spacer external surface: screw the dowel and matrix the motor shaft with a tip;
– grease the pinion teeth, the sealing ring rotary seat and the seal ring (with KLÜBER Petamo GHY 133N), and assemble carefully, **paying attention not to damage the seal ring lip due to accidental shock with the pinion toothing.**

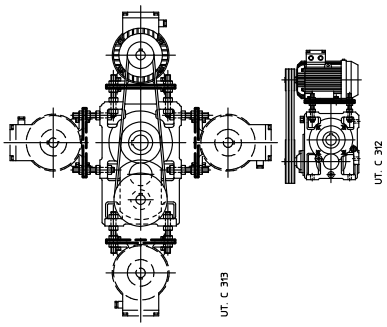
Shaft mounting arrangements

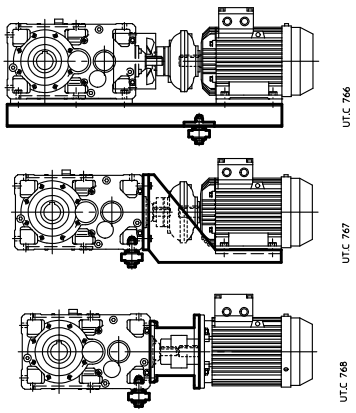
The strength and shape of the housing offer advantageous possibilities for shaft mounting (for several reaction arrangements which can be supplied, see ch. 17 «Shaft mounting arrangements»), even - for instance - gearmotor with belt drive, with hydraulic coupling, low speed shaft support, etc.

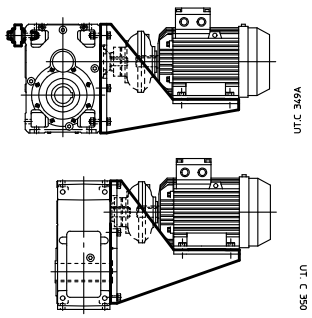
A few shaft mounting arrangements are shown here with the relative details as to selection, and installation.

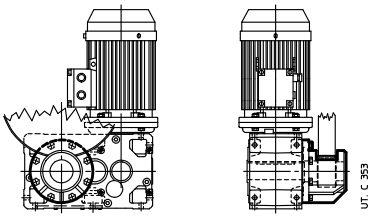
IMPORTANT: When shaft mounted, the gearmotor must be supported both axially and radially (even for mounting positions B3 ... B8) by the shaft end of driven machine, as well as anchored against rotation only, by means of a reaction having **freedom of axial movement** and sufficient clearance in its couplings to permit minor oscillations - always in evidence - without provoking dangerous overloads on the gearmotor. Lubricate with proper products the hinges and the parts subject to sliding; when tightening the screws it is recommended to apply locking adhesives type LOCTITE 601.

In case of shaft-mounting arrangement with elastic constraint, for the sizes 140 ... 360 C2I, 2I, 3I in B3 or B8 mounting position, ensure that the housing oscillation, during the running, not overtake - towards the top - the horizontal position.

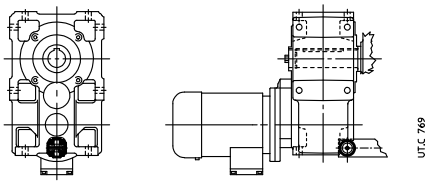




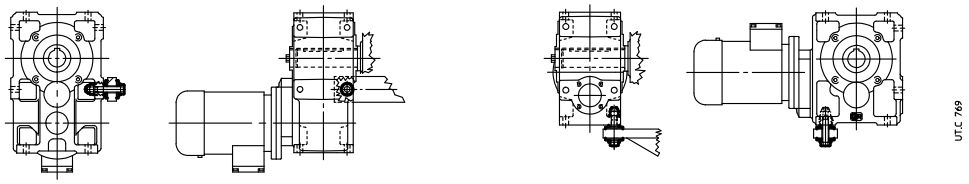




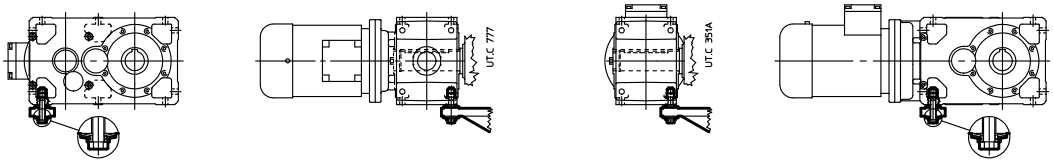
Semi-flexible and economic reaction arrangement for 2I, 3I, 4I sizes ⩽ 125 (ch. 17) using **reaction recess and disc springs**.



Semi-flexible and economic reaction arrangement for sizes ⩽ 125 (ch. 17), with **bolt using disc springs**, suitable for low torque values.

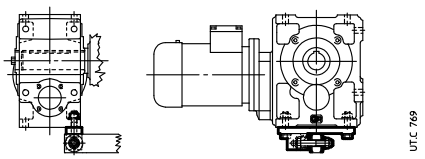


Semi-flexible and economic **reaction arrangement** for sizes ⩾ 140 (⩾ 125 for CI; ch. 17), **using disc springs**. Safety devices may be installed to prevent accidental overloads.

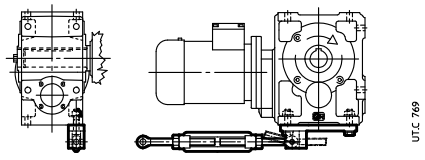


Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

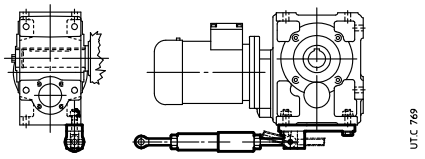
Semi-flexible reaction arrangement (ch. 17), **using disc springs and bracket**.



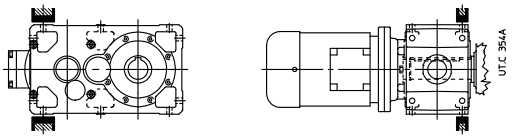
Rigid torque arm reaction arrangement for variable distance anchorage (ch. 17).
If the direction of rotation is opposite to that given in the fig. rotate the torque arm by 180°.

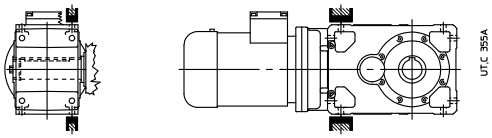


Reaction arrangement see above (ch. 17), but **flexible**; safety devices may be installed to prevent accidental overloads
The flexible torque arm may be turned through 180° regardless of direction of rotation.



Flexible reaction arrangement using **rubber buffers** (drawings are approximate, but the buffers will be positioned abutting with gear reducer housing). It is possible to install safety devices against accidental overloads.



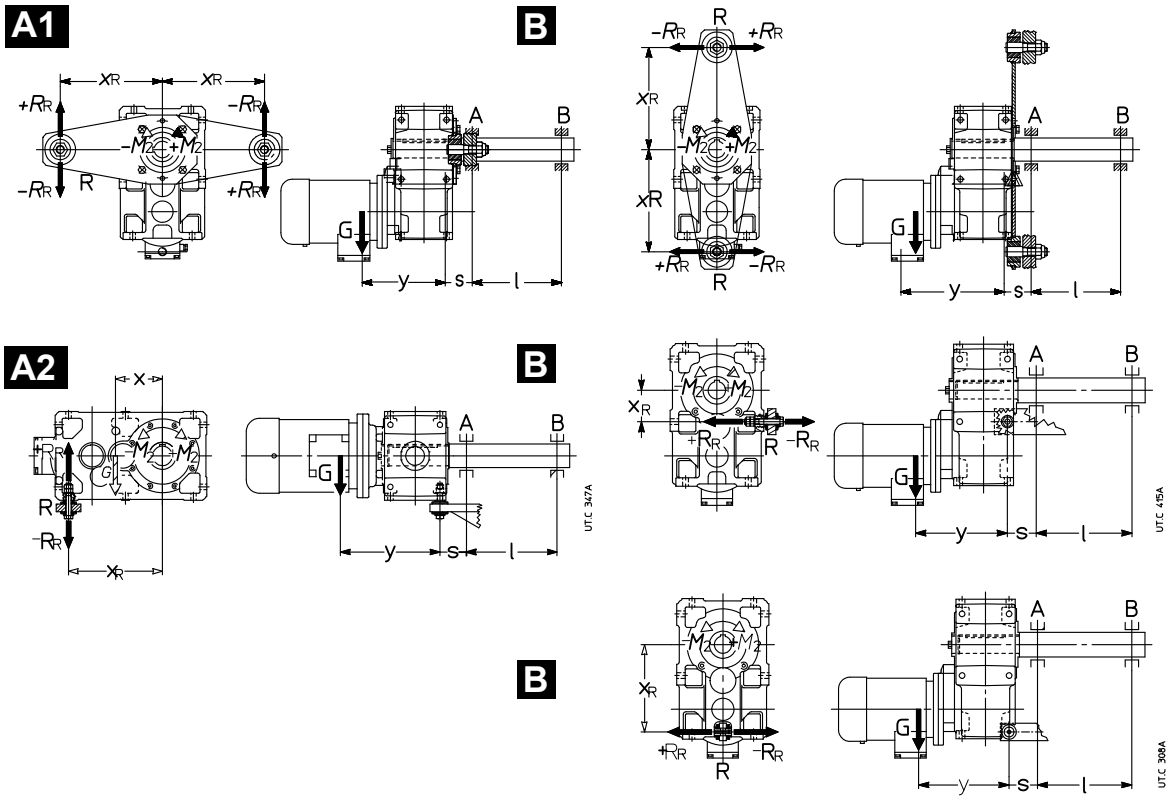


Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

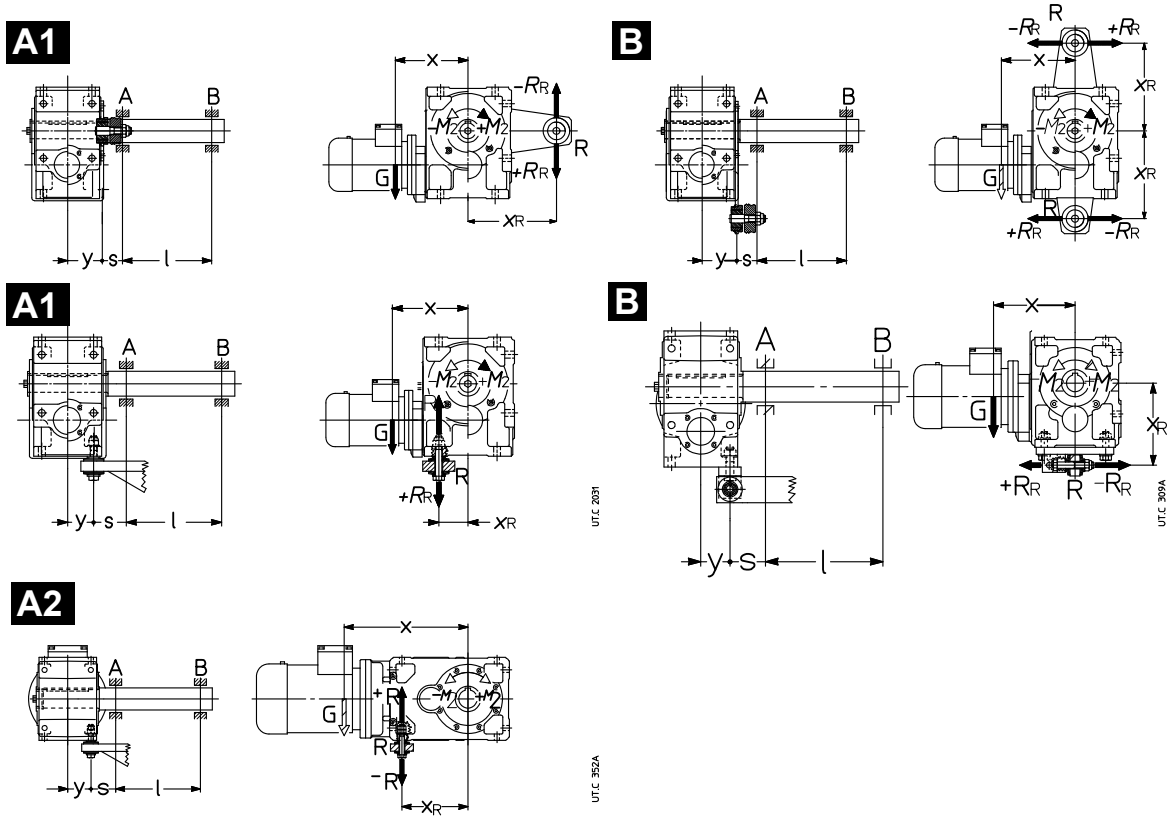
18. Installation and maintenance

For the majority of normal cases, where weight force G is parallel or orthogonal to reaction R_R as illustrated in the drawings, reactions are calculated thus (verify the worst condition) valid for long model too:

Helical gear units



Bevel helical gear units



Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

– G [lb]: weight force almost equal numerically to gearmotor mass (ch. 12 and 14) · 10;
– T_2 [lb in]: output torque expressed by + or – according to the direction of rotation in the drawing;
– x [in]: for helical gearmotors dimension x = 0 (scheme A1 and B) or x = 0,67 · a (scheme A2) (ch. 12); for bevel helical gearmotors dimension x = G + 0,2 · Y (schemes A1 and B) or x = a + G + 0,2 · Y (scheme A2) (ch. 14);
– y [in]: for helical gearmotors dimension y = 0,5 · B + G + 0,2 · Y (ch. 12); for bevel helical gearmotors dimension y = 0,5 · B (ch. 14);
– x_R [in]: see ch. 12, 14, 17;
– l, s [in]: dimension s must be as short as possible.

1) reaction R_R produced by support R:

$$R_R = (1 / x_R) \cdot [G \cdot x + (\pm T_2)] \quad [lb]$$

2) bending moment T_{fA} through the cross-section of bearing A:

A1 **A2** $T_{fA} = [G \cdot (y + s)] - [(\pm R_R) \cdot s]$ [lb in]

B $T_{fA} = \sqrt{[G \cdot (y + s)]^2 + [R_R \cdot s]}$ [lb in]

3) radial reaction R_A produced by bearing A:

A1 **A2** $R_A = \frac{1}{l} \{[G \cdot (y + s + l)] - [(\pm R_R) \cdot (s + l)]\}$ [lb]

B $R_A = \frac{1}{l} \sqrt{[G \cdot (y + s + l)]^2 + [R_R \cdot (s + l)]}$ [lb]

4) radial reaction R_B produced by bearing B:

$$R_B = \frac{T_{fA}}{l} \quad [lb]$$

Tightening torque

Unless otherwise stated, usually it is sufficient to use bolts in class 8.8.

- Before tightening the bolt be sure that the eventual centering of flanges are inserted properly
- The bolts are to be diagonally tightened with the maximum tightening torque.

Before tightening, carefully degrease the bolts; for strong vibrations, heavy duties, frequent motion reversals, apply a thread-braking seal Loxeal 23-18 or equivalent.

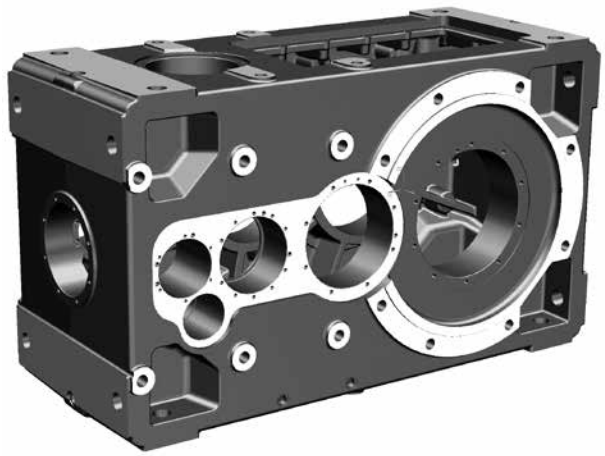
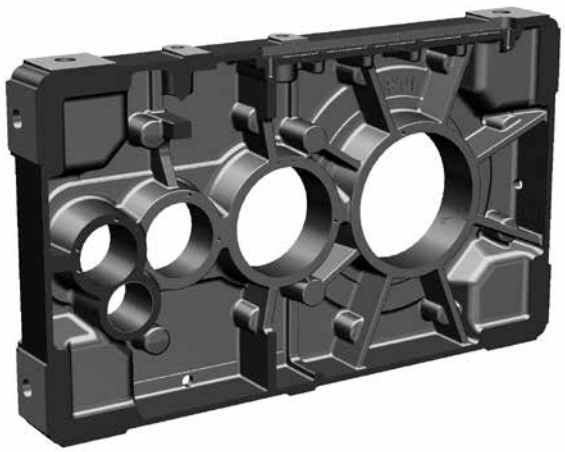
Universal mounting: suitable for horizontal or vertical mounting
Rigid and precise single-piece nodular cast iron housing; high oil capacity
Hollow low speed shaft as standard
Pre-arranged for motor bell housing
Pre-arranged for backstop device
Double extension high speed shaft
Single or double extension solid low speed shaft, hollow shaft with shrink disc,
Two sizes: standard (400) and strengthened (401)

Main structural features

Main specifications are:

- **universal mounting** with integral **feet** to housing on 4 faces and with **B14 flange** on 2 faces; design and strength of the housing permit interesting shaft mounting solutions, foot mounted motor (s. ch. 31) and mounting for auxiliary devices;
- gear reducer overall sized so as to permit the transmission of **high nominal and maximum torques,** and to withstand **high loads on** the high and low speed **shaft ends**;
- standard **hollow low speed shaft** in steel with keyway and retaining ring grooves for extraction; standard low speed shaft (overhanging right or left) or double extension low speed shaft (s. ch. 30);
- cylindrical high speed shaft end with key;
- **possibility of second high speed shaft extension (excluding C3I);**
- improved and upgraded modular construction both for component parts and assembled product;
- standardized dimensions and compliance with standards;
- **nodular cast iron single-piece** housing (400-15 UNI ISO 1083); stiffening ribs and high oil capacity;
- bearings: swinging roller bearings on low and intermediate speed shafts, **coupled** taper roller bearings plus one swinging roller bearing on high speed shafts with train of gears 2I, C2I, C3I and intermediate train of gears C2I, taper roller bearing plus one cylindrical roller bearing on high speed shaft with train of gears 3I;
- oil bath lubrication; synthetic or mineral oil (ch. 31) including filler plug with **valve**, drain and level plug; sealed;
- additional bearings lubrication through proper pipelines or pump;
- natural or forced cooling (by fan, coil or independent cooling unit with heat exchanger, see ch. 30);
- paint: external coating in water-soluble dual-compound polyurethan enamel resistant to atmospheric and aggressive agents (corrosivity class C3 ISO 12944-2); suitable for further coats only with dual-compound products after degreasing and sanding; color blue RAL 5010 DIN 1843, other colors and/or painting cycles on request, see ch. 30); internal protection in synthetic paint appropriate for resistance to mineral oils or to polyalphaolefines synthetic oils;
- non-standard designs: backstop device (always prearranged), shaft mounting arrangements, one or double extension solid low speed shaft, **hollow** low speed shaft with shrink disc, special paints, etc. (ch. 30).





Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Train of gears

- 2, 3, 4 cylindrical gear pairs (helical gear units);
- 1 bevel gear pair plus 2, 3 helical gear pairs (bevel helical type);
- 1 double size (standard and strengthened)
- nominal transmission ratios to R 20 series for trains of gears 2I (i_N = 10 ... 25); 3I (i_N = 25 ... 125, excluding i_N = 112), and C2I (i_N = 20 ... 125, excluding i_N = 112); to R 10 series for 4I (i_N = 125 ... 315) and C3I (i_N = 125 ... 315);
- casehardened and hardened gear pairs in 16 CrNi4 or 20 MnCr5 (depending on size) and 18 NiCrMo5 steel, according to UNI 7846-78;
- helical toothed cylindrical gear pairs with **ground** profile;
- GLEASON spiral bevel gear pairs with **ground** profile;
- gear load capacity calculated for tooth breakage and pitting.

Specific standards

- nominal transmission ratios and principal dimensions according to UNI 2016 (DIN 323-74, NF X 01.001, BS 2045-65, ISO 3-73);
- toothing profile to UNI 6587-69 (DIN 867-86, NF E 23.011, BS 436.2-70, ISO 53-74);
- shaft heights to UNI 2946-68 (DIN 747-76, NF E 01.051, BS 5186-75, ISO 496-73);
- medium series fixing holes to UNI 1728-83 (DIN 69-71, NF E 27.040, BS 4186-67, ISO/R 273);
- cylindrical shaft ends to UNI ISO 775-88 (DIN 748, NF E 22.051, BS 4506-70, ISO/R 775) with tapped butt-end hole to UNI 9321 (DIN 332 BI. 2-70, NF E 22.056) excluding correspondence d-D;
- parallel keys UNI 6604-69 (DIN 6885 BI. 1-68, NF E 27.656 and 22.175, BS 4235.1-72, ISO/R 773-69);
- mounting positions derived from CEI 2-14 (DIN EN 60034-7, IEC 34.7);
- load capacity verified according to UNI 8862, DIN 3990, AFNOR E 23-015, ISO 6336; thermal capacity verified.

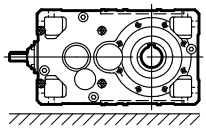
Gear reducer mounting position

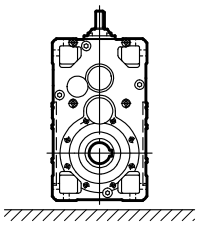
Mounting positions of gear reducers and gearmotors are stated at ch. 26, 28 (the designation of mounting position is referred to foot mounting only, even if gear reducers are in universal mounting). Here following see some designation examples of important mounting positions.

1. **Standard** mounting position **B3**; in case of no specific needs, **prefer the adoption of B3 mounting positions** as it is the most advised from a technical and economic point of view (maximum simplification of lubrication system, lower oil splash, lower gear reducer heating, stock availability).

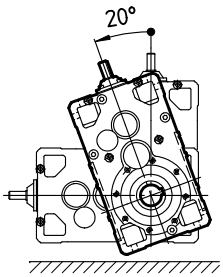


2. **Non-standard** mounting positions

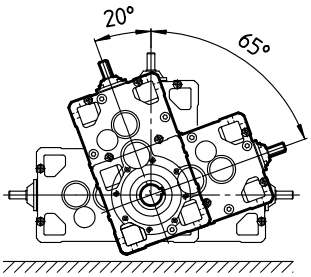
2a. Mounting position to catalog (see ch. 26, 28), **one only** and **fixed**, differing from B3; e.g.: mounting position **B6**



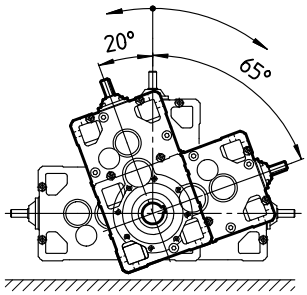
2b. **Inclined** and **fixed** mounting position ; e.g.: mounting position **B6 - 20° B3**



2c. **One only mounting** position **but defined within a predetermined angle**; e.g.: mounting position included among **B6 - 20° B3 / B6 - 65° B8**



2d. **Oscillatory mounting position** (gear reducer oscillating when running); e.g.: mounting position **B6 - 20° B3 / B6 - 65° B8 oscillatory**



UT_C_2088

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Input speed

The designation is to be completed stating the input speed n_1, in the following cases:
– n_1 > 1800 rpm or $n_1 \leqslant$ 355 rpm;
– for cases highlighted with following symbols (▲, ,) (ch. 26, 28);
– when forced cooling is required.

Example:

R 2I 400 UP2A/17.6 **mounting position V5**, n_1 **= 900 rpm**

R C2I 401 UO2A/51.3 **mounting position B3**, n_1 **= 2000 ÷ 600 rpm**

Accessories and non-standard designs

In the event of a gear reducer being required in a design different from those stated above, specify it in detail (ch. 35).

21 - Service factor *fs*

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

21 - Service factor *fs*

Service factor ***fs*** takes into account the different running conditions (nature of load, running time, frequency of starting, speed n_2, other considerations) which must be referred to when performing calculations of gear reducer selection and verification.

The power and torques shown in the catalog are nominal values (i.e. valid for ***fs*** = 1).

The **minimum service factor required** is given by the following ratio:

$$\boldsymbol{fs} \text{ required} \geqslant \boldsymbol{fs}_1 \cdot \boldsymbol{fs}_2 \cdot \boldsymbol{fs}_3 \cdot \boldsymbol{fs}_4 \cdot \boldsymbol{fs}_5$$

where fs_1 … fs_5 are stated in the following tables.

Service factor $\boldsymbol{fs}_1$ based on the **nature of load** and **running time**

Nature of load[1] of the driven machine		$\boldsymbol{fs}_1$ Running time [h/d] ⩽				
Ref,	Description	**2**	**4**	**8**	**16**	**24**
a	Uniform	1	1	1	1.18	1.32
b	**Moderate overloads** (1.6 times the normal load)	1.12	1.18	1.25	1.5	1.7
c	**Heavy overloads** (2.5 times the normal load)	1.4	1.5	1.7	2	2.24

Service factor $\boldsymbol{fs}_2$ based on **nature of load** and of **frequency of starting**

Nature of load[1] of the driven machine		$\boldsymbol{fs}_2$ Frequency of starting ***z*** [starts/h]					
Ref.	Description	**1**	**2**	**4**	**8**	**16**	**32**
a	Uniform	1	1.06	1.12	1.18	1.25	1.5
b	**Moderate overloads** (1.6 times the normal load)	1	1	1.06	1.12	1.18	1.4
c	**Heavy overloads** (2.5 times the normal load)	1	1	1	1.06	1.12	1.32

Service factor $\boldsymbol{fs}_3$ based on **motor type**

Motor type Description		$\boldsymbol{fs}_3$
Electric, turbine		1
Electric three-phase brake motor		1.06[4]
Internal combustion	multi-cylinder	1.25
	single-cylinder	1.5

Service factor $\boldsymbol{fs}_4$ based on **reliability level**

Reliability level[5]	$\boldsymbol{fs}_4$
Standard	1
Average	1.25
High	1.4

Service factor $\boldsymbol{fs}_5$ based on **output angular speed** $\boldsymbol{n}_2$

Output speed n_2 [rpm]	$\boldsymbol{fs}_5$
> 560	1.32
560 ÷ 355	1.25
355 ÷ 224	1.18
224 ÷ 140	1.12
140 ÷ 90	1.06
⩽ 90	1

Details and considerations about service factor.

fs values stated above are valid for:

- maximum time on overload 15 s, on starting 3 s; if over and/or subject to heavy shock effect, consult us;
- a whole number of overload cycles (or start) **imprecisely completed** in 1, 2, 3 or 4 revolutions of low speed shaft; if **precisely**, a continuous overload should be assumed;

Motors having a starting torque not exceeding nominal values (star-delta starting, particular types of motor operating on direct current, and single-phase motors), and particular types of coupling between gear reducer and motor, and gear reducer and driven machine (flexible, centrifugal, fluid and safety couplings, clutches and belt drives) affect service factor favourably, allowing its reduction in certain heavy-duty applications; consult us if need be.

1) For indication on the type of load of the driven machine according to the application, see table on next page.

4) For Y- Δ starting, running with inverter or with «soft start» devices, fs_3 = 1.

5) Reliability degrees higher than normal are required in presence of very difficult maintenance, great importance of gear reducer in the production cycle, safety, etc.

22 - Thermal power *Pt* [hp]

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

22 - Thermal power *P*t [hp]

The nominal thermal power Pt_N, stated in red in the table, is that which can be applied at the gear reducer input, without exceeding 203 °F[1] (95 °C[1])approximately oil temperature when operating in following running conditions:

- input speed n_1 = 1 500 rpm;
- mounting position B3;
- continuous duty S1;
- maximum ambient temperature 68 °F (20 °C) (in the table the values referred to 104 °F (40 °C) are stated as well);
- maximum altitude 3 300 ft above sea level;
- air speed ⩾ 4 ft/s (typical value in presence of a self-cooled motor).

Nominal thermal power Pt_N

Size	T_{amb}	Pt_N [hp]		
		2I	3I, C2I	4I, C3I
400, 401	20 °C	355	300	224
	40 °C	300	224	170

Always verify that the power applied P_1 is lower than or equal to gear reducer thermal power Pt_N multiplied by correction coefficients ft_1, ft_2, ft_3, ft_4, ft_5 (stated in the following tables) considering the various operating conditions:

$$P_1 \leqslant Pt_N \cdot ft_1 \cdot ft_2 \cdot ft_3 \cdot ft_4 \cdot ft_5$$

When the power applied is not constant and when the exact load cycle is given, it is possible, or advisable, to calculate the equivalent power applied, according to the formula:

$$P_{1th} = \frac{1}{\eta} \cdot \sqrt[3]{\frac{P^3_{2_1} \cdot t_1 + P^3_{2_2} \cdot t_2 + \ldots + P^3_{2_i} \cdot t_i + \ldots + P^3_{2_n} \cdot t_n}{t_c}}$$

where:
η is the gear reducer efficiency (see ch. 6);
P_{2i} [hp] is the power, referred to the gear reducer output, required in the time interval t_i [s];
$t_c = t_1 + t_2 + \ldots + t_i + \ldots + t_n$ is the total duration of load cycle [s].

In these cases choose factor ft_2 from the continuous duty column S1.

Whenever the thermal verification should not be satisfied, in spite the prearrangement of cooling system, it is possible to install an **independent cooling unit with heat exchanger** (see ch. 30.(29)); consult us.

Thermal power needs not be taken into account when maximum duration of continuous running time is 1 ÷ 3 h (from small to large gear reducer sizes) followed by rest periods long enough to restore the gear reducer to near ambient temperature (likewise 2 ÷ 4 h). For maximum ambient temperature higher than 104 °F (40 °C) or lower than 32 °F (0 °C) consult us.

1) Corresponding to an average temperature of the external housing surface of approximately 185 °F (85 °C); locally housing temperature can achieve the oil temperature.
1) If, simultaneously, forced cooling with coil is acting, multiply the values by 1,8.
4) For positions, dimensions and design verification see ch. 30.
5) Value also valid for electric fan (installed by the Buyer).
6) With axial fan, values are to be multiplied by 1.12. Consult us.
7) (Duration of running on load / 60) · 100 [%].

23.1 - Preliminary considerations

Motor power

Taking into account the efficiency of the gear reducer, and other drives – if any – motor power is to be as near as possible to the power rating required by the driven machine: accurate calculation is therefore recommended.

The power required by the machine can be calculated, seeing that it is related directly to the power-requirement of the work to be carried out, to friction (starting, sliding of rolling friction) and inertia (particularly when mass and/or acceleration or deceleration are considerable). It can also be determined experimentally on the basis of tests, comparisons with existing applications, or readings taken with amperometers or wattmeters.

An oversized motor would involve: a greater starting current and consequently larger fuses and heavier cable; a higher running cost as power factor (cos w) and efficiency would suffer; greater stress on the drive, causing danger of mechanical failure, drive being normally proportionate to the power rating required by the machine, not to motor power.

In such cases, a detailed description of duty requirement must be made available: duration and frequency per hour of work cycle, acceleration and deceleration requirements if any, inertia, loads deriving from friction and work. In the absence of such data it is essential to provide all details which will permit their determination.

Only high values of ambient temperature, altitude, frequency of starting or other particular conditions require an increase in motor power.

Input speed n_1

The maximum gear reducer input speed, valid for **continuous duty S1 and in absence of a forced lubrication system of gears and bearings** (**with eventual heat exchanger**), is stated in the following table according to train of gears and gear reducer size; however, according to specific transmission ratio, this limit could not be achieved: in these cases, in the selection tables (s. ch. 25, 27), performance P_{N2} is not stated and value T_{N2} is valid only for B selection method (s. 23.2).

For intermittent duty or for particular needs, higher speeds are possible, but always lower than n_{1peak}; consult us.

Peak speed is admitted for a maximum duration of 5 s, including a proper rest period or a low speed period for the cooling of gear reducer, especially on high speed shaft side.

For variable n_1, the selection should be carried out on the basis of n_{1max}, but it should also be verified on the basis of n_{1min}.

When there is a belt drive between motor and gear reducer, different input speeds n_1 should be examined in order to select the most suitable unit from engineering and economy standpoints alike.

Input speed should not be higher than 1 800 rpm, unless conditions make it necessary; better to take advantage of the transmission, and use an input speed lower than 900 rpm.

Size	Train of gears											
	2I			**3I**		**4I**		**C2I**			**C3I**	
	i_N	n_{1max} rpm	n_{1peak} rpm	n_{1max} rpm	n_{1peak} rpm	n_{1max} rpm	n_{1peak} rpm	i_N	n_{1max} rpm	n_{1peak} rpm	n_{1max} rpm	n_{1peak} rpm
400, 401	⩽ 11.2 ⩾ 12.5	1 600 1 800	2 120 2 120	1 800	2 240	1 800	2 360	⩽ 25 ⩾ 28	1 500 1 800	2 240 2 240	1 800	2 360

23.2 - Determining the gear reducer size

Constant load

- Fill out the questionnaire for the selection on page 392; in particular, make available required output power P_2, the angular speeds n_2 and n_1, the running conditions (nature of load, frequency of starting h/d, frequency of starting z, other considerations) referring to ch. 21.
- Determine service factor f_s required on the basis of running conditions (ch. 21).
- Select the gear reducer size (also, the train of gears and transmission ratio i at the same time) on the basis of n_2, n_1 and of a power P_{N2} greater than or equal to $P_2 \cdot f_s$ (ch. 25 and 27).
- Calculate power P_1 required at input side of gear reducer using the formula P_2 / η, where $\eta = 0.97 \div 0.94$ is the efficiency of gear reducer (ch. 24).

When for reasons of motor standardization, power P_1 applied at input side of gear reducer turns out to be higher than the power required (considering motor/gear reducer efficiency), it must be certain that this excess power applied will never be required, and frequency of starting z is so low as not to affect service factor (ch. 23. (3).

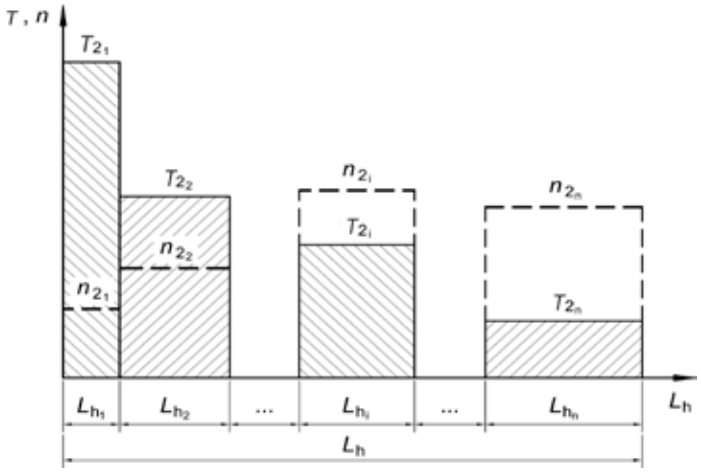
Otherwise, make the selection by multiplying P_{N2} by P_1 applied / P_1 required.

Calculations can also be made on the basis of torque instead of power; this method is even preferable for low n_2 values.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Variable load

- Fill out the questionnaire for the selection on page 392; in particular, make available the torque T_2 and the angular speed n_2 required at gear reducer output, the running conditions (nature of load, duration of running required, frequency of starting z, other considerations) referring to ch. 21.
- In presence of required torque T_2 and angular speed n_2 variable in time, according to a given load cycle, calculate the equivalent torque T_{2eq} and angular speed n_{2eq} with the following formulae:



$$T_{2eq} = \sqrt[p]{\frac{T_{2_1}^p \cdot n_{2_1} \cdot L_{h_1} + T_{2_2}^p \cdot n_{2_2} \cdot L_{h_2} + \ldots + T_{2_i}^p \cdot n_{2_i} \cdot L_{h_i} + \ldots + T_{2_n}^p \cdot n_{2_n} \cdot L_{h_n}}{n_{2_{eq}} \cdot L_h}}$$

$$n_{2_{eq}} = \frac{n_{2_1} \cdot L_{h_1} + n_{2_2} \cdot L_{h_2} + \ldots + n_{2_i} \cdot L_{h_i} + \ldots + n_{2_n} \cdot L_{h_n}}{L_h}$$

where:

T_{2eq}	[lb in] is the load cycle equivalent torque
T_{2_i}	[lb in] is the required torque (constant) on the low speed shaft during interval *i*
n_{2eq}	[rpm] is the load cycle equivalent speed
n_{2_i}	[rpm] is the speed (constant) of the low speed shaft in the interval *i*
Lh_i	[h] is the duration of interval *i*
Lh	[h] $Lh_1 + ... + Lh_i + ...+ Lh_n$ is the total duration of load cycle
p =	3.33 for a running duration > 8 h/d
p =	6.61 for a running duration ≤ 8 h/d

23.3 - Verifications

- Verify possible radial loads F_{r1}, F_{r2} and axial loads F_{a2} according to instructions and values given in ch. 29.
- When a load chart is available, and/or there are overloads – due to starting on full load (especially with high inertias and low transmission ratios), braking, shocks, gear reducers in which the low speed shaft becomes driving member due to driven machine inertia, or other static or dynamic causes - verify that the maximum torque peak (ch. 24) is always lower than $2 \cdot T_{N2}$, if hither or if it cannot be evaluated in the above cases – install a safety device so that $2 \cdot T_{N2}$. will be never exceeded.
- Verify for each single interval i of the eventual load cycle that the required torque T_{2i} is lower than $2 \cdot T_{N2}$ and therefore never higher than T_{N2} valid for $n_1 \leqslant 90$ rpm (see ch. 25 and 27) and that input speed (relevant to output shaft speed n_{2i}) is $n_{1i} \leqslant n_{1max}$ (s. ch. 23.1);
- Verify the possible need for forced cooling (ch. 22 and 30).
- Verify that the input speed is lower than or equal to n_{1max} (see ch. 23.1);
- For gear reducers with backstop device, having particular i_N or low values of fs, verify max load capacity of backstop device (ch. 30).

23.4 - Selection questionnaire

Make available all data and information necessary for a correct gear reducer selection by filling out the questionnaire on next page.

Attach any technical specifications relevant to gear reducer, excluding data regarding the machine of the plant.

When possible, attach all possible drawings, pictures and/or any further information facilitating the technical and economic selection.

1) To ISO/CD 8579.

2) Mean value of measurement at 1 m from external profile of gear reducer standing in free field on a reflecting surface.

3) In the speed range n_1 = 750 ÷ 1 500 rpm, sum to the table values: –5 dB(A) for 750 rpm; –4 dB(A) for 1000 rpm; –3 dB(A) for n_1 = 1 200 rpm; –2 dB(A) for n_1 = 1 500 rpm.

Efficiency

The efficiency stated in the table is rough and referred to nominal running conditions (torque, speed, temperature); it is necessary to keep in mind that the efficiency value can diminish considerably for values of $T_2 << T_{N2}$

Nominal efficiency	Helical gear reducers			Bevel helical gear reducers	
	R 2I	R 3I	R 4I	R C2I	R C3I
η	0.970	0.955	0.940	0.955	0.940

Overloads

When a gear reducer is subjected to high static and dynamic overloads, the need arises for verifying that such overloads will always remain lower than $2 \cdot T_{N2}$ (see ch. 25, 27).

Overloads are normally generated when one has:

– starting on full load (especially for high inertias and low transmission ratios), braking, shocks;

– gear reducers in which the low speed shaft becomes driving member due to driven machine inertia;

– applied power higher than that required; other static or dynamic causes.

The following general observations on overloads are accompanied by some formulae for carrying out evaluations in certain typical instances.

Where no evaluation is possible, install safety devices which will keep values within T_{N2}.

Starting torque

When starting on full load (especially for high inertias and low transmission ratios) verify that $2 \cdot T_{N2}$ is equal to or greater than starting torque, by using the following formula:

$$T_2 \text{ start} = \left(\frac{T \text{ start}}{T_N} \cdot T_2 \text{ available} - T_2 \text{ required}\right) \frac{WK_R^2}{WK_R^2 + WK_0^2} + T_2 \text{ required}$$

where:

T_2 required is the torque absorbed by the machine through work and frictions;

T_2 available is the output torque due to motor nominal power;

WK_0^2 is the moment of inertia (of mass) of the motor;

WK_R^2 is the external moment of inertia (of mass) (gear reducers, couplings, driven machine) referred to the motor shaft;

NOTE: when seeking to verify that starting torque is sufficiently high for starting, take into account starting friction, if any, in evaluating T_2 required.

Stopping machines with high kinetic energy (high moments of inertia combined with high speeds) with brake motor

Verify braking stress by means of the formula:

$$\left(\frac{Tf}{\eta} \cdot i + T_2 \text{ required}\right) \frac{WK_R^2}{WK_R^2 + WK_0^2} - T_2 \text{ required} < 1.6 \cdot T_{N2}$$

where:

Tf is the braking torque applied on high speed shaft; for other symbols see above and ch. 19.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Moment of inertia (of mass) WK_1^2 [lb ft²]

The moment of inertia is referred to the high speed shaft of gear reducer, standard design; the one referred to the low speed shaft is given by following ratio: $WK_2^2 = WK_1^2 \cdot i^2$

Gear red, size	Moment of inertia of mass WK_1^2 [lb ft²]

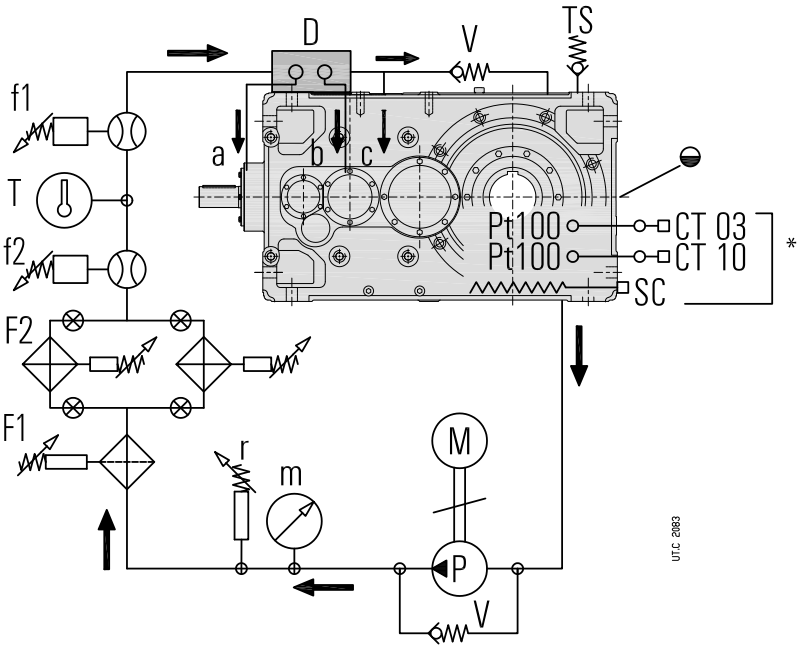
Forced lubrication of bearings and/or gears with motor pump: hydraulic circuit diagram

NOTE: Bearings and/or gear pairs to be forced lubricated are defined by Rossi according to gear reducer and application.



As standard

a, b, c	Gear pair/bearing pipes
m	Pressure gauge (0 - 16 bar)
M	Motor pump (ch. 30(29))
P	Pump (ch. 12(29))
T	Thermometer 32 - 248 °F (0 - 120 °C)
V	Safety valve
r	Minimum pressure gauge
TS	Filler plug
D	Flow rate
◒	Approx. oil level

On request

Pt100*	Oil temperature probe (loose)*
f1	Electric flow switch: vertical mounting
f2	Visible flow switch
F1	Filter
F2	Exchange filter
CT03N*, CT10N*	Control devices with 2 and 3 thresholds (separately supplied); supply 230 V 50 Hz*
SC*	Oil heater*

* On request, but necessary for gear reducer starting at $T_{ambient}$ (= T_{oil}) ⩽ 77 °F (25 °C): pre-heat the oil with the heater.

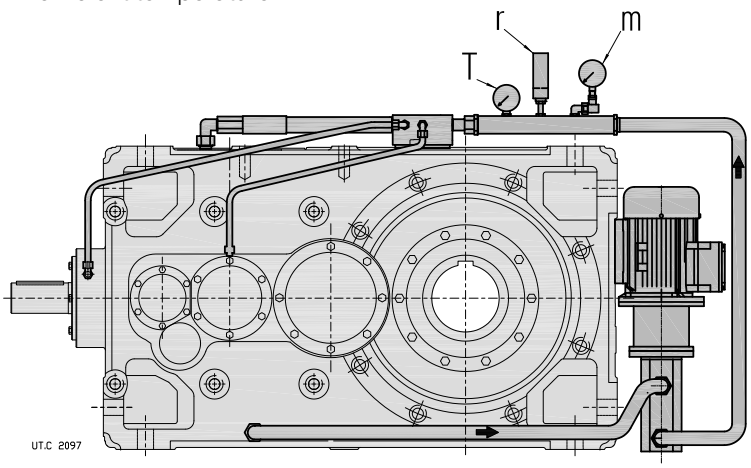
Starting at low temperature T_{oil} = $T_{ambient}$ ⩽ 77 °F (25 °C) of gear reducer with forced lubrication

Always foresee the oil heater and the 2-threshold signalling device CT03N + Pt100 and the 3-threshold signalling device CT10N + Pt100.

– **CT03N** (2-threshold device) and relevant temperature probe Pt100, to pilot the heater; set the operating threshold at 122 °F (50 °C) (stopping the heater supply) and the reset threshold at 86 °F (30 °C).

– **CT10N** (3-threshold device) and relevant temperature probe Pt100 to start the motor pump and the motor of gear reducer; it is advised to delay the starting of gear reducer motor by at least 1 min from the motor pump starting so that oil is already circulating: the motor pump must run simultaneously with gear reducer; set the operating threshold at 86 °F (30 °C) to start the gear reducer and the motor pump, the reset threshold at 32 °F (0 °C) (50 °F (10 °C)) when having the independent cooling unit with heat exchanger) and the safety threshold at 194 °F (90 °C).

For starting with T_{oil} (= $T_{ambient}$) ⩽ 32 °F (0 °C) the devices CT03N and CT10N must be set according to the real ambient temperature.



Example of forced lubrication with motor pump; the exact position of motor pump depends on the gear reducer size, train of gears, mounting position and available dimensions: for this reason, on request, a drawing of the specific solution will be supplied; pipes are usually realized with sucation and delivery flexible pipes and with rigid pipes between the flow rate and the bearings.

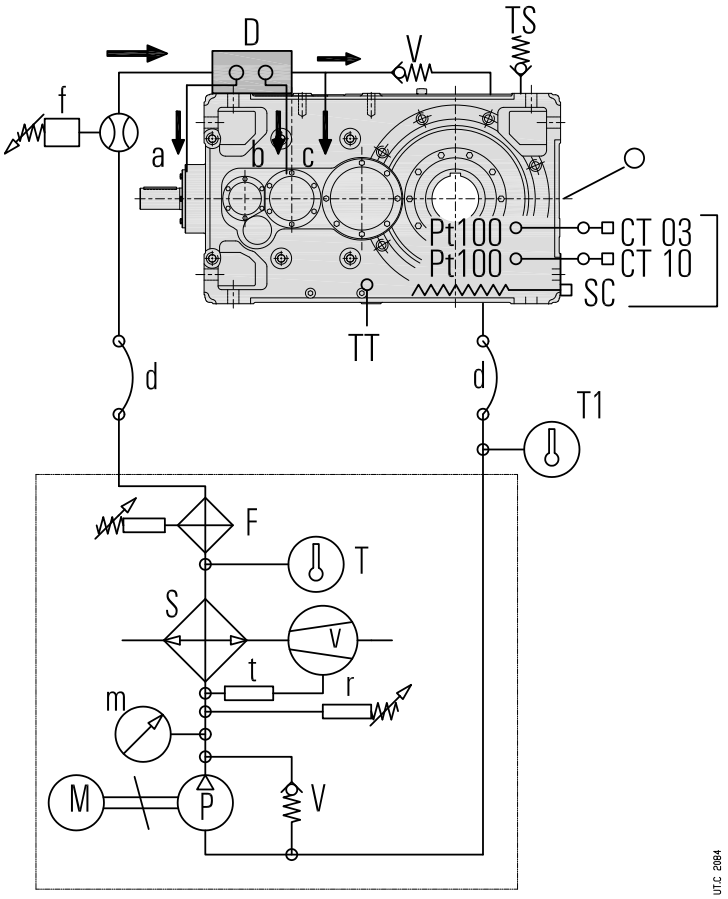
Bearing and/or gear pair forced lubrication with oil/air or oil/water independent cooling unit: hydraulic circuit diagram

NOTE: Bearings and/or gear pairs to be forced lubricated are defined by Rossi according to gear reducer and application.



As standard

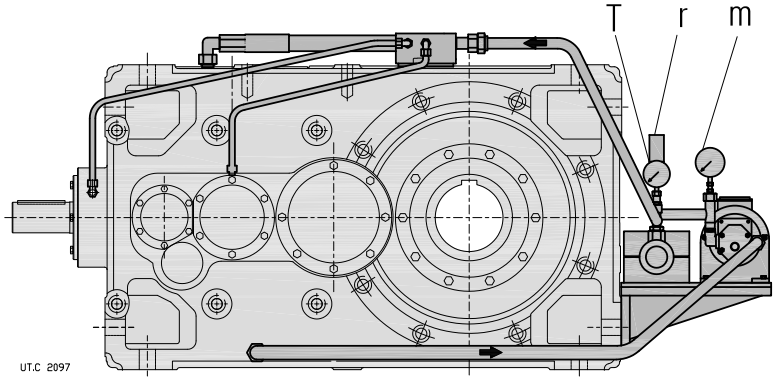
a, b, c	Gear pair/bearing pipes
d	Flexible connection (by Customer)
m	Pressure gauge (0 - 16 bar)
M	Motor pump (ch. 30(29))
P	Pump (ch. 30(29))
S	Oil/air or oil/water exchanger
v	Motor fan (UR O/A...)
t	Fan thermostat 32 - 248 °F (0 - 120 °C) (UR O/A)
T	Thermometer 32 - 248 °F (0 - 120 °C)
V	Safety valve
r	Minimum pressure gauge
TS	Filler plug
D	Flow rate
◒	Approx. oil level

On request

Pt100*	Oil temperature probe (loose)*
f	Flow switch (loose)
F	Filter with electric blockage warning (with UR O/A... it is supplied loose)
CT03N*, CT10N*	Signalling device (loose)*
T1	Thermometer 32 - 248 °F (0 - 120 °C)
TT	Bi-metal type thermostat
SC*	Oil heater*

* On request, but necessary for gear reducer starting at $T_{ambiene}$ (= T_{oil}) ≤ 77 °F (25 °C): pre-heat the oil with the heater.

For **starting at low temperature**: s. previous page.



Example of forced lubrication with cooling unit: the exact position of cooling unit depends on the gear reducer size, on train of gears, mounting position and available dimensions: for this reason, on request, a drawing of specific solution is supplied; the pipes are usually realize3d with suction/delivery flexible pipes and with rigid pipes between the flow rate and the bearings.

29 - Radial loads

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

29.1 - Radial loads F_{r1} [lb] on high speed shaft

Radial loads generated on the shaft end by a drive connecting gear reducer and motor must be less than or equal to those given in the relevant table.

n_1	F_{r1} [lb]		
rpm	**2I**	**3I, C2I**	**4I, C3I**
1 800	4500	2800	1120
1 500	4750	3000	1180
1 200	5000	3150	1250
1 000	5300	3350	1320
710	6000	3750	1500
560	6300	4000	1600
450	6700	4250	1700
355	7500	4750	1900
F_{r1max}	**7500**	**4750**	**1900**

The radial load F_{r1} given by the following formula refers to most common:

$$F_{r1} = \frac{189\,090 \cdot P_1}{d \cdot n_1}$$ [lb] for timing belt drive

$$F_{r1} = \frac{315\,150 \cdot P_1}{d \cdot n_1}$$ [lb] for V-belt drive

where:
P_1 [hp] is the power required at the input side of gear reducer;
n_1 [rpm] is the speed;
d [in] is the pitch diameter.

Radial loads given in the table are valid for overhung loads on centre line of high speed shaft end, i.e. operating at a distance of 0,5 · e (e = shaft end length) from the shoulder. If radial loads are in a different position, i.e. at a distance differing from 0,5 e from shoulder, multiply the admissible radial load value by 1,25 (without exceeding the maximum value F_{r1max}, stated in the table) if acting at 0,315 · e; by 0,8 if acting at 0,8 · e .

It is always advisable **to mount the pulley against the shaft shoulder** and in any case to avoid that the pulley exceeds the shaft end.

An **axial load** of up to 0,2 times the value in the table is permissible, simultaneously with the radial load.

In absence of the radial load, an axial load may be acting on center line, not higher than 0,5 times the stated radial load.

IMPORTANT: tabulated values for radial load F_{r1} can increase considerably in certain instances (direction of rotation, angular position of load, etc.). If necessary and/or in presence of **misaligned** axial loads, consult us.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

29.1 - Radial loads F_{r1} [lb] on high speed shaft end

V-belt drives

See the table for the driving pulleys advised for the various powers and motor polarities and the radial loads resulting on motor and gear reducer shaft ends.

The transmissions have been calculated with a service factor ⩾1,4; replace section SPA with SPB, section SPB with SPC, section SPC with 8V, in order to increase the service factor with the same ***d*** and belt number.

The radial loads have been calculated according to the formula: $(315\ 150 \cdot P_1) / (d \cdot n_1)$.

The radial load F_{r1}, referring to the selected motor pulley, must be lower than or equal to the one admitted by gear reducer.

IMPORTANT. For the good running of drive and in order not to overload motor and gear reducer bearings, reduce the overhung to a minimum and do not stress belts excessively. Pulleys with d ⩾ 16 must be dynamically balanced.

Motor			Motor pulley: belt number and section, pitch diameter ***d*** [in], radial load F_{r1} [lb]													
P_1 hp	Size and pole n.			***d***	F_{r1} ≈		***d***	F_{r1} ≈		***d***	F_{r1} ≈		***d***	F_{r1} ≈		***d***	F_{r1} ≈

29.2 - Axial loads F_{a2} [lb] or radial loads F_{r2} [lb] on low speed shaft end

Axial loads F_{a2}

Permissible F_{a2} is shown in the column where direction of rotation of low speed shaft (black or white arrow) and direction of the axial force (solid or broken arrow) correspond to those of the gear reducer in question. Direction of rotation and direction of axial force may be established viewing the gear reducer from any point of the two output sides of low speed shaft, providing the same point is adopted for rotation and axial load (see fig. below).

Notes:

- White and black arrows of present chapter do not refer to the ones stating the correspondence of direction of rotation for the different designs (see ch. 26, 28);
- Wherever possible, choose the load conditions corresponding to the column with highest admissible values.
- Values stated in the table are valid for the center line axial load; in the event of a misaligned axial load, consult us.

Radial loads F_{r2}

Radial loads generated on the shaft end by a drive connecting gear reducer and machine must be less than or equal to those given in the relevant tables in the following pages.

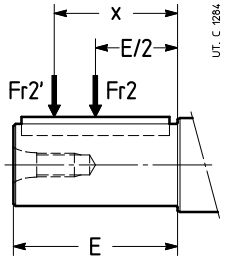
Normally, radial loads on low speed shaft ends are considerable: in fact there is a tendency to connect the gear reducer to the machine by means of a transmission with high transmission ratio (economizing on the gear reducer) and with small diameters (economizing on the drive, and for requirements dictated by overall dimensions). Bearing life and wear (which also affect gears unfavourably) and low speed shaft strength, clearly impose limits on permissible radial load.

IMPORTANT. Permissible radial loads given in the tables are valid for design with one-extension **solid low speed shaft;** for hollow low speed shaft or solid double extension low speed shaft, consult us.

Permissible radial loads given in the tables are therefore based on: the low speed shaft side where radial load is applied according to low speed wheel position (see ch. 26 and 28), the product of speed n_2 [min^{-1}] for the bearing duration L_h [h] required, the direction of rotation, the angular position φ [°] the load and torque T_2 [lbf in] required.

Permissible radial loads given in the tables are valid for overhung loads on center line of high speed shaft end, i.e. operating at a distance of 0,5 · E (E = shaft end length) from the shoulder. If radial loads are in a different position, i.e. at a distance differing from 0,5 · E from shoulder, re-calculate the permissible value of radial load according to the following formula, trying not to exceed the maximum value F_{r2max}, stated in the tables:

$$F_{r2}' = F_{r2} \cdot \frac{E/2 + y}{x + y} \quad [lb]$$



Size	y
400	561
401	554

where:

$F_{r2'}$ [lb] is the permissible radial load acting at the distance x from shaft shoulder;
F_{r2} [lb]] is the permissible radial load acting on center line of high speed shaft end (see table on next page);
E [mm] is the shaft end length (see ch. 25, 27);
y [mm] is given in the table;
x [mm] is the distance between the shaft shoulder and the load application point.

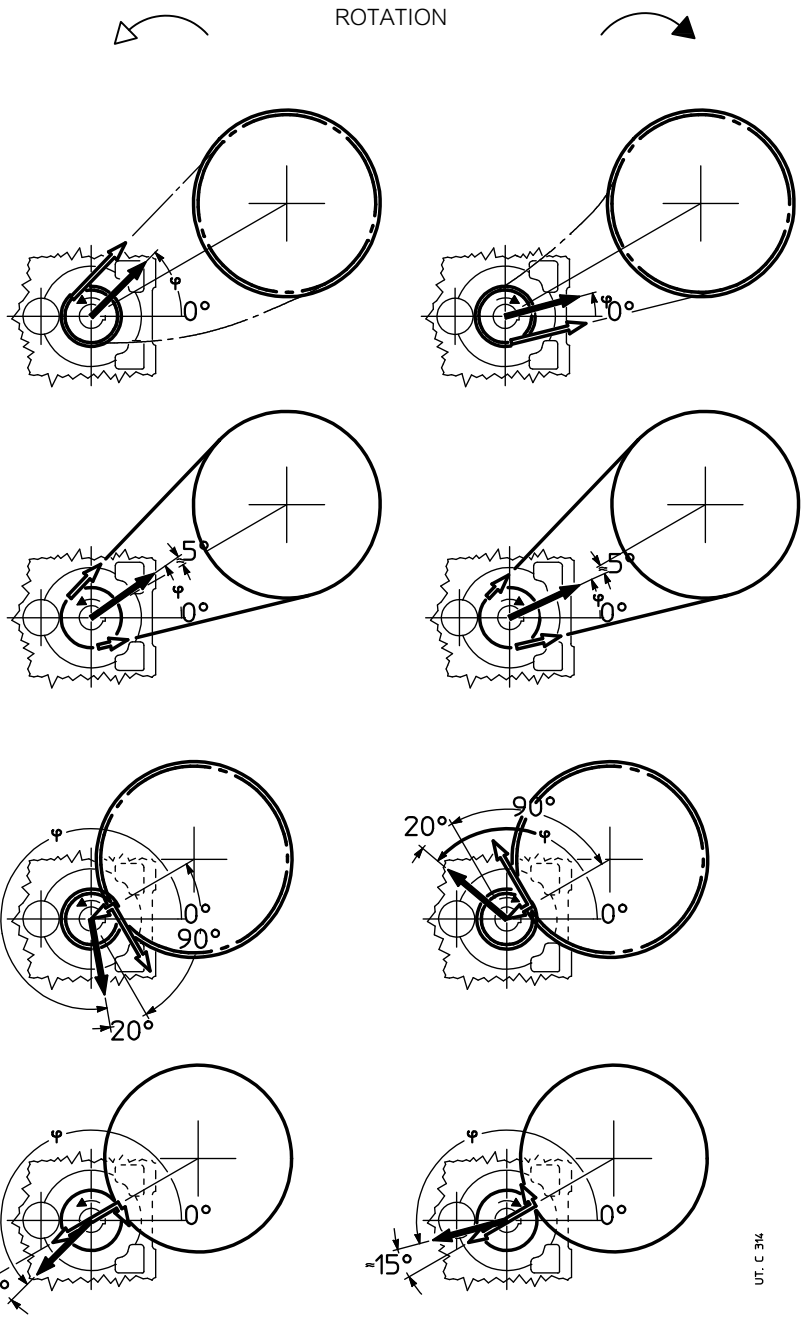
29.2 - Axial loads F_{a2} [lb] or radial loads F_{r2} [lb] on low speed shaft end

Radial load F_{r2} for most common drives has the following value and angular position:



$$F_{r2} = \frac{12\,600 \cdot P_2}{d \cdot n_2}\ [\text{lb}]$$

for chain drive (lifting in general);
for timing belt drive replace
126 000 with 189 090

$$F_{r2} = \frac{315\,150 \cdot P_2}{d \cdot n_2}\ [\text{lb}]$$

for V-belt drive

$$F_{r2} = \frac{134\,110 \cdot P_2}{d \cdot n_2}\ [\text{lb}]$$

for spur gear pair drive

$$F_{r2} = \frac{447\,550 \cdot P_2}{d \cdot n_2}\ [\text{lb}]$$

for friction wheel drive
(rubber-on-metal)

where: P_2 [hp] is the power required at the output side of the gear reducer, n_2 [rpm] is the speed, d [in] is the pitch diameter.

IMPORTANT: 0° coincides with a straight line concurrent with the axis of the last reduction and orientated as shown above, and therefore it follows the rotation of the housing, as shown below.

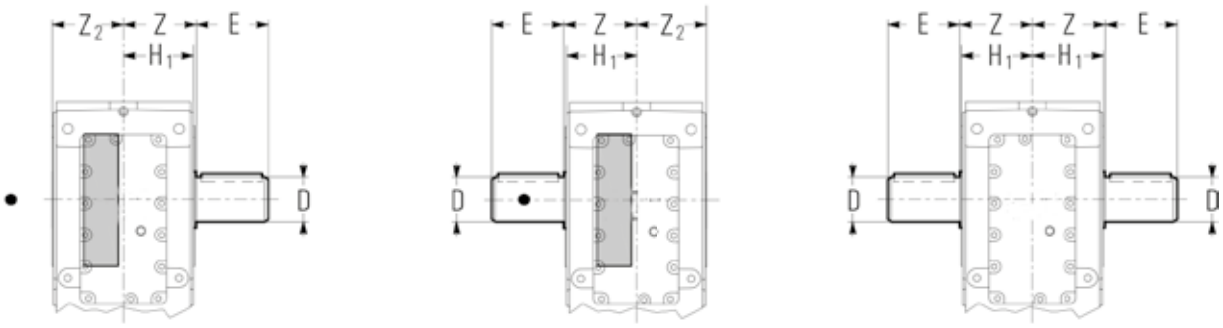
ATTENTION. The simultaneous presence on the same gear reducer of two or more accessories or non-standard designs is not always possible: consult us, if need be.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(2) Solid low speed shaft



UT.C 2067

- Low speed wheel position (s. ch. 26 and 28) for the verification of radial load.

Size	**D** Ø	**E**	**Z**	**Z_2**	**H_1**	Δlb standard	Δlb double extension
400	190 m6	280	330	328	322	+330	+485
401	200 m6	280	330	328	322	+330	+507

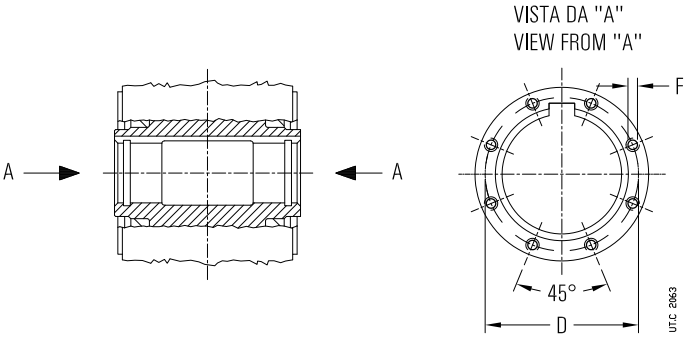
Standard mounting position is with solid low speed shaft end on opposite side to low speed wheel. For reverse mounting, specify in designation «**mounted on groove side**».

The external diameter of the element or of the spacer abutting with the gear reducer must be (1.25 ÷ 1.4) · D; hole tolerance D H7 ... K7.

Other dimensions at ch. 24 «High and low speed shaft end».

Supplementary description when ordering by designation: **standard**, or **double extension low speed shaft**.

(4) Hollow low speed shaft with front holes



Size	**D** Ø	**F**[1]		$F_{a\,max}$[2] lb
400, 401	234	M14	No. 8	118 000

1) Thread depth 2 · F.
2) Maximum total axial load for screws class 8.8.

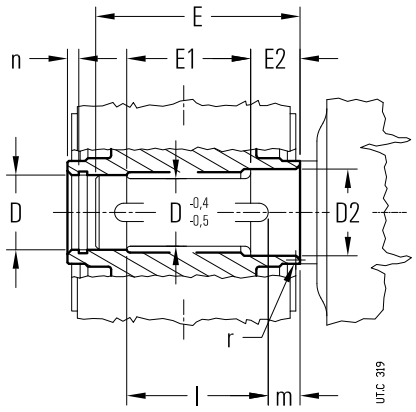
Hollow low speed shaft including tapped butt-end holes. The dimensions of threaded holes and the maximum axial load deriving from relevant screws in class 8.8 are stated in the table.

ATTENTION. This axial load cannot be sufficient to assure the dismounting of gear reducer from machine shaft end. In fact, according to coupling tolerances selected to realize the machine shaft end and according to coupling type suitable for installation environment and duty type (e.g.: alternate cycles, overloads, etc.) – the dismounting could require an extraction force much higher than threading capabilities, which would be in that case irremediably damaged. In these cases it is advised to adopt the extraction system through hollow low speed shaft washer (see ch. 30 (20)).

Supplementary description when ordering by **designation**: **hollow low speed shaft with front holes**.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(5) Stepped hollow low speed shaft



Size	D Ø	D_2 Ø	E 2)	E_1	E_2 2)	E_2 1) 2)	l	m	n	r
400, 401	200 H7	210 H7	620	300	165	130	600	10	14	5

1) Values valid for **R 4I**.

2) In presence of «Low speed shaft seal with labyrinth and grease feeder» (ch. 30 (26)) it is necessary to increase the dimension E (E2) of quantity A stated in the table on ch. 30 (26).

Stepped hollow low speed shaft, with keyway; this design **facilitates** installation and removal and **affords a notable increase** in rigidity and resistance to bending and torsional stresses at the shaft end of the driven machine.

D_2 hole is always **opposite to groove side.**

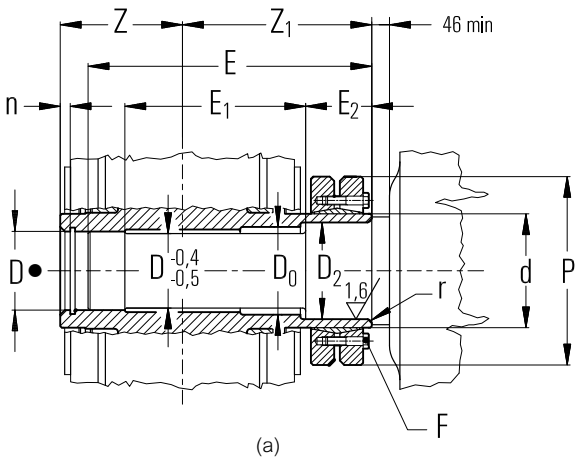
Important: the shoulder diameter of the driven machine shaft end abutting with the gear reducer must be at least (1.18 ÷ 1.25) · D.

Supplementary description when ordering by **designation**: stepped hollow low speed shaft.

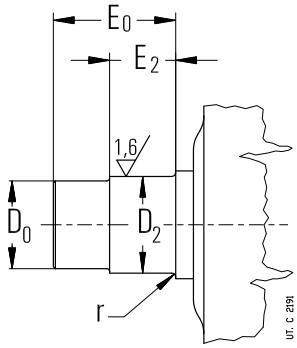
Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(6) Hollow low speed shaft with shrink disc

Side to machine



(a)
Stepped hollow low speed shaft with locking assembly and «long» machine shaft end



(b)
«Short» shaft end of driven machine

● Low speed wheel position (see ch. 26 and 28), except for train of gears 4I where the low speed wheel is on machine side

Gear reducer size	D Ø H7 / h6, j6	D_2 Ø	D_0 Ø	E	E_0	E_1	E_2	E_2 1)	F 2)	M_S 3) N m	n	d Ø	P Ø	r	Z	Z_1	T_{2SD} 4) klb in	Δlb
400, 401	210	220	215	754	607	446	165	130	M20 n. 14	490	14	260	430	5	330	463	2522	+220

1) Values valid for **R 4I**.
2) Screws UNI 5737-88 class 10.9
3) Screw tightening torque.
4) Maximum torque value transmissible by shrink disc.

Stepped hollow low speed shaft with shrink disc on **machine side** (interposed between gear reducer and machine); this design **facilitates** installation and removal and **affords** a notable increase in rigidity of keying, **reduces** the deformations of machine shaft end, **avoiding** the necessity of safety guards on the unit itself. Moreover, since deformability of keying area is greater ($d - D_2 < d - D$) and friction area acts on a greater diameter ($D_2 > D$), maximum transmissible torque increases by 18 ÷ 25% compared to the solution with shrink disc on opposite side to machine.

For a further axial fastening and in order to facilitate the assembling and disassembling operations (see ch. 31), it is possible to make use of hollow low speed shaft washer with retaining ring and bolt for axial fastening (on request).

For the shaft end of driven machine on which gear reducer stepped hollow low speed shaft must be keyed, it is possible to adopt both «long» and «short» shaft end of driven machine: dimensions as per table.

In the first case (fig. a), where the «long» shaft end of driven machine acts as a guide, mounting operations are facilitated.

In the second case (fig. b), the reduced axial dimension of the «short» shaft end of driven machine, limits the mounting and removing overall dimensions at the very least.

In both cases the rigidity and the resistance to bending and torsional stresses at the shaft and of driven machine do not change, since the only surface through which torque transmission occurs is the D_2 one.

IMPORTANT. The shoulder diameter of the driven machine shaft end abutting with the gear reducer must be at least (1.18 ÷ 1.25) · D.

Supplementary description when ordering by **designation: hollow low speed shaft with shrink disc, on machine side.**

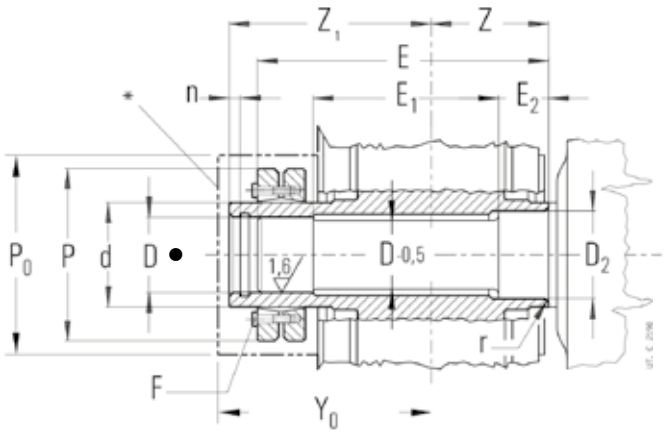
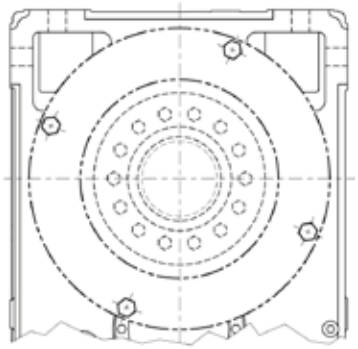
Opposite side to machine



UT.C 2190-2192



Safety guard
for shrink disc

● Low speed wheel position (see ch. 26 and 28), except for train of gears 4I where the low speed wheel is on machine side

Gear reducer size	D Ø H7 / h6, j6	D_2 Ø	E 5)	E_1	E_2 5)	E_2 1) 5)	F 2)	M_S 3) N m	n	d Ø	P Ø	P_0 Ø	r	Z	Z_1	Y_0 ≈	T_{2SD} 4) klb in	Δlb
400, 401	210	220	788	480	165	130	M20 n. 14	490	14	260	430	450	5	330	497	522	+2248	+220

1) Values valid for **R 4I**.
2) Screws UNI 5737-88 class 10.9
3) Screw tightening torque.
4) Maximum torque value transmissible by shrink disc.
5) In presence of «Labyrinth seal and low speed shaft grease feeder» (ch. 30 (26)) it is necessary to increase the dimension E (E2) of quantity A stated in the table on ch. 30 (26).

* Protection for hollow low speed shaft with shrink disc, on request.

Stepped hollow low speed shaft with shrink disc on **machine opposite side**.

This design, compared with the machine side design, improves the accessibility to the shrink disc but it is more expensive and with a lower torsional stiffness; the shrink disc transmits a lower torque.

A protection for the shrink disc for personal safety-guard is supplied as standard, see chapter below for details.

IMPORTANT. The shoulder diameter of the driven machine shaft end abutting with the gear reducer must be at least (1.12 ÷ 1.18) · D.

Supplementary description when ordering by **designation: hollow low speed shaft with shrink disc, on machine opposite side.**

(7) Protection for hollow low speed shaft with shrink disc

Safety protections, made of steel, for gear reducers equipped with hollow low speed shaft with shrink disc on machine opposite side (groove side).

For dimensions and assembly sketch see «Low speed shaft with shrink disc on machine opposite side». «Hollow low speed shaft with shrink disc on machine opposite side».

The accessory is supplied already fitted as standard when ordering the option «Hollow low speed shaft with shrink disc on machine opposite side» .

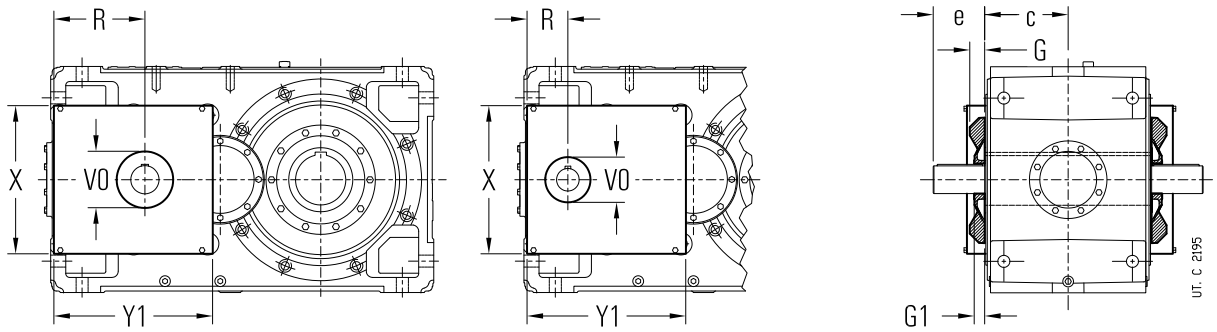
(15) Fan cooling

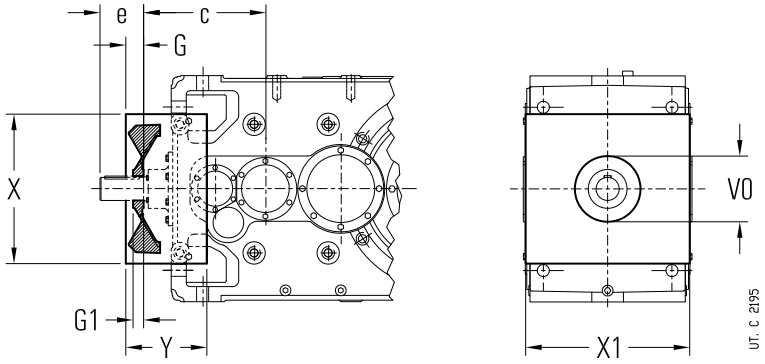
The **helical** gear reducers **R 2I** and **R 3I** can be supplied with **one** or **two** cooling fans keyed on high speed shafts. For dimensions **e**, and **c** see ch. 26.



Gear reducer size	G 1)	2I G_1 2)	2I R	2I V_0 Ø	3I G_1 2)	3I R	3I V_0 Ø	X	Y_1
400, 401	63	50	363	220	40	163	175	560	633

1) Bolts projecting 6 mm from **G** dimension.
2) The high speed shaft end length is equal to **e - G_1**.

The **bevel helical** gear reducers **R C2I** can be supplied with **one** only cooling fan keyed onto high speed shaft.
For dimensions **e** and **c** see ch. 28.

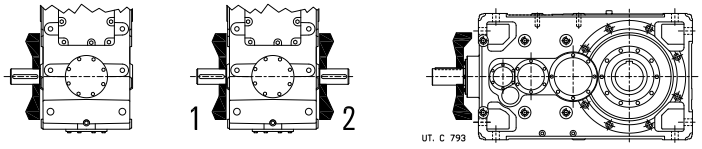


Gear reducer size	G	G_1 2)	V_0 Ø	X	X_1 1)	Y
400, 401	72	47	220	590	640	310

1) Bolts projecting 6 mm from dimension **X_1**.
2) The high speed shaft end length is equal to **e - G_1**.

With double extension high speed shaft designs both extensions are accessible even with fan fitted: personnel safety-guards are the Buyer's responsibility (2006/42/EEC).

Possible designs and positions are those illustrated below.



Temperature of cooling air must not exceed ambient temperature.

Supplementary description when ordering by **designation**: **fan cooling**; in design with double extension high speed shaft state if pos. **1** or **2** or – only for helical gear units – **1 and 2**.

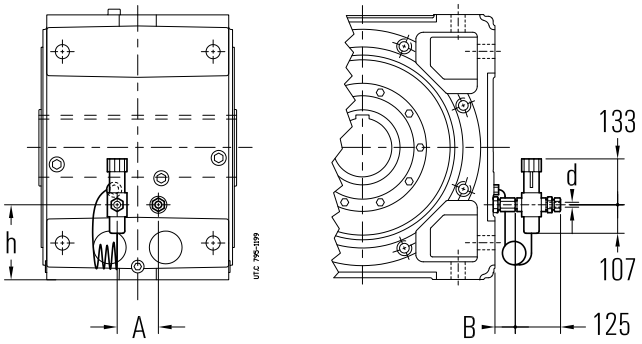
Also available independent cooling unit with heat exchanger (see ch. 30 (29)); consult us if need be.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(16) Water cooling by coil

Coil made of copper alloy for gear reducer water cooling. On request, available also stainless steel coil (AISI 316) or cupro-nickel, consult us.

Design not possible for vertical mounting positions (V5, V6) with low speed shaft wheel positioned on the bottom.



Gear reducer size	**A**[1] ≈	**B**[1] ≈	**d** Ø	**h**
400, 401	140	45	16	255

1) Values valid for mounting position B3 and designs U ... A; for other mounting positions and/or designs, consult us.

Cooling water specifications:
– be not too hard ≤ 12 °F (French degrees);
– be at max temperature 68 °F (20 °C);
– capacity 2.6 ÷ 5.2 gal/min;
– pressure 29 ÷ 58 psi (2 ÷ 4 bar).

A polished metallic pipe (with external diameter **d** stated on table) is sufficient for the connection.

The load loss of coil, according to capacity and water pressure, is approximately 9 ÷ 12 psi.

On request thermostatic valve which, automatically and without auxiliary supply need, permits water circulation when gear reducer oil reaches the set temperature; the valve sensor is equipped with immersion bulb. Mounting and setting, adjustable within 122 ÷ 194 °F (50 ÷ 90 °C), are Buyer's responsibility.

For ambient temperature lower than 32 °F (0 °C) consult us.

Supplementary description when ordering by **designation**: **water cooling by coil** or **water cooling by coil and thermostatic valve**.

(17) Cooling by internal exchanger

Gear reducers sizes 400, 401 helical type 2I and 3I, bevel helical type C2I and C3I design UO2A, UO2H, UO2V can be equipped with **internal** and **extractable** heat exchanger, made of aluminium, mounted on gear reducer inspection cover (facilitating the maintenance operations) for the water cooling of lubrication oil.

The value of thermal factor ft_{1b} according to mounting position is given in the table.

Dimensions on request: consult us.

Cooling water specifications:
– be not too hard ≤ 12 °F (French degrees);
– max temperature 68 °F (20 °C);
– capacity 2.6 ÷ 5.2 gal/min;
– pressure 29 ÷ 58 psi (2 ÷ 4 bar).

Gear reducer size	ft_{1b} B3	B6, B7	B8, V5, V6
400, 401	2	2.24	2.12

A polished metallic pipe with external diameter **Ø16** is sufficient for the connection, paying attention to keep fixed the fillet using a second hexagon wrench, when fastening the pipe on the fillet.The load loss in the internal exchanger, according to capacity and water pressure, is 20 ÷ 26 psi for diameter Ød 16 and 26 ÷ 29 psi for Ød 12.

On request thermostatic valve which, automatically and without auxiliary supply need, permits water circulation when gear reducer oil reaches the set temperature (after technical technical feasibility verification, consult us); the valve sensor is equipped with immersion bulb. Mounting and setting, adjustable within 122 ÷ 194 °F (50 ÷ 90 °C), are Buyer's responsibility.

For ambient temperature lower than 32 °F (0 °C) consult us.

Supplementary description when ordering by **designation**: **independent cooling with internal exchanger**.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(18) Additional oversized diameter housing hole for oil cooling from external circuit

In the event of an oil cooling system through centralized external circuit (e.g.: paper plants) it is necessary to foresee an additional hole of proper dimensions on gear reducer housing in order to allow the lubricant flow for gravity.

The setting of oil flow at gear reducer input must be executed during running by the Customer.

The heat quantity dissipated by the system depends on oil flow and on input and output oil temperature difference.

Available only for mounting positions B3 and B8.

Tapped butt-end hole **G 2 1/2"**.

Supplementary description when ordering by **designation: additional oversized diameter housing holes.**

(19) Forced bearing lubrication

All gear reducers according to train of gears, design, transmission ratio, mounting position, input speed and duty cycle can be equipped with a non-oil-bath forced bearing lubrication system through **internal piston pump** or external **lubrication system with motorpump** (see ch. 24).

The following table resumes the cases (see at ch. 26, 28) where – **according to the only mounting position** and for continuous duty – it is necessary to foresee the bearing lubrication. For other operating conditions, consult us.

Train of gears	Designs	Presence of **lubrication pump** Mounting position					
		B3	**B6**	**B7**	**B8**	**V5**	**V6**
2I, 3I, 4I	**all**	–	–	–	n.a.	P	P
C2I	**UO2A, UO2N sin**	–	P	–	n.a.	P	P
	UO2H, UO2M sin	P	P	–	n.a.	P	P
	UO2V, UO2L sin	P	–	–	–	P	P
C3I	**all**	–	P	–	n.a.	P	P

– Forced bearing lubrication not necessary.
P Forced bearing lubrication necessary (with pump or motor pump).
n.a. Mounting position not foreseen.

For cases highlighted with ▲ ch. 25 and 27, foresee the lubrication with **motor pump** and possible heat exchanger (see ch. 22, 24, 30(29)).

IMPORTANT. For the running at cold starting $T_{ambient} = T_{oil} \leqslant 77$ °F (25 °C) and lubrication systems (see also ch. 24 and 30 (11)), **always foresee the oil heater** (see ch. 30 (25)).

In general, when the maximum system reliability is required, in presence of particulary heavy load cycles or hard ambient conditions, it is recommended to evaluate the possibility to install anyway the bearing lubrication motor pump; consult us.

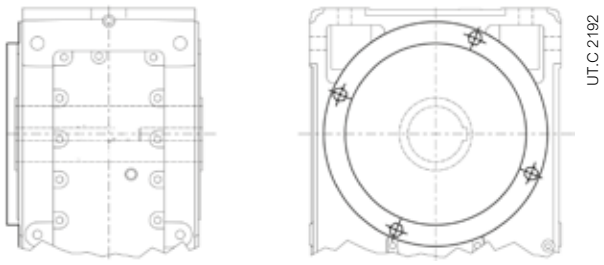
Supplementary description when ordering by **designation**: **bearing lubrication pump** or **bearing lubrication motor pump**.

(20) Hollow low speed shaft washer

Gear reducers with hollow low speed shaft or with hollow low speed shaft with shrink disc can be equipped with washer, retaining ring and screw for axial fastening (see ch. 31).

Supplementary description when ordering by **designation**: **hollow low speed shaft washer**.

(22) Hollow low speed shaft



UT.C 2192

Safety protections, made of steel, of the area not used of the hollow low speed shaft. The protection is to be mounted on low speed wheel side (on the opposite side for R 4I; see also ch. 26 and 28). Dimensions on request; consult us.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(24) Optional paint (sizes 400, 401)

The gear reducers and gearmotors can be supplied with optional painting cycles, according to following table
Additional description when ordering by **designation**: **optional paint ...** (see code stated in the table; i.e.: «**optional paint 2HRAL5010**».

Application field	Features	Corrosivity class ISO 12944-2	Durability classes ISO 12944-2	Description	Average final thickness on machined parts µm	Code

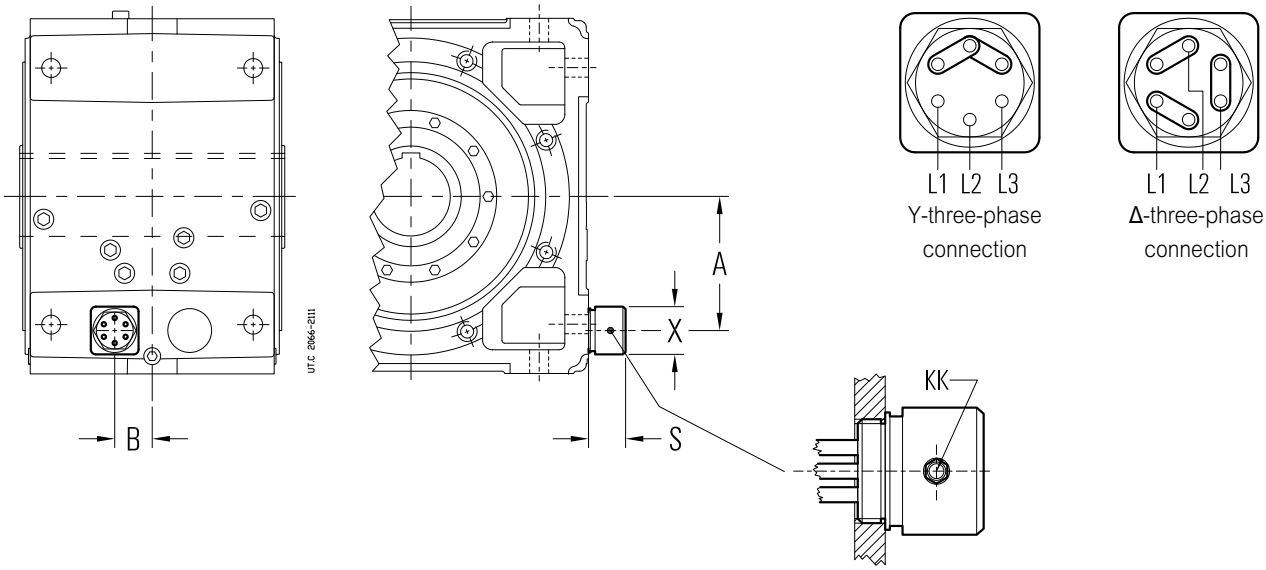
(25) Oil heater



Gear reducer size	A	B	S ≈	X	KK	Supply	P hp
400, 401	340	95	90	85	Pg13	~ 3 Δ230 Y400 V - 50 Hz	n. 1 × 2.8

Oil heater for gear reducer starting at low ambient temperature.

Specify the design «Oil temperature probe» together with this design.

The heater is piloted through proper control device (at customer's care e.g..: PLC or supplied by Rossi e.g. 2-threshold signalling device CT03 or three-threshold signalling device CT10) releasing when achieving the pre-set oil temperature.

IMPORTANT. The data stated in the table refer to mounting positions **B3**; for other mounting positions, consult us.

The design can be not compatible with other designs, consult us.

Features:
- specific power 2.5 hp/ft$^{2;}$
- three-phase supply Δ230 Y400 V 50-60 Hz;
- stainless steel resistors AISI 321;
- metallic terminal box; cable gland Pg13; protection IP 65;
- horizontal mounting with oil bath lubrication;
- max oil temperature 194 °F (90°C);
- threaded brass joint G 2"½;
- available also in ATEX design; dimension and power values change, please consult us.

Available also in a version equipped with integrated thermostat.

Supplementary description when ordering by **designation**: **oil heater** or **oil heater with thermostat.**

(26) High and low speed shaft seals

Available seal types (standard and on request) on high and low speed shafts are stated in the following table.

- Acrylonitrilic seal ring compound as standard; fluoro compound seal rings are available on request (e.g.: for high temperatures, for aggressive environments or for high rotation speeds, etc.); specify in the designation: **fluoro compound seal**.
- The **high speed shaft double seal** is usually not advised as the increased heating reduces the seal life.
- In case of **double seal**, the external seal ring can be mounted on the contrary (e.g. water jets); specify in the designation: external ring mounted on the contrary.
- The design **high speed shaft seal with labyrinth and greaser** can be supplied only after technical feasibility evaluation by Rossi S.p.A.: consult us.
- The **hollow shaft with shrink disc** (see ch. 30 (6)) can be supplied with labyrinth seal only on shrink disc **opposite side**; in this case, it is necessary to foresee «**hollow low speed shaft protection with shrink disc**» (see ch. 30 (7)); when this design is not available, consult us.

For the supplementary description when ordering by **designation**, see table.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Seal type	Scheme
Standard	Double seal on high speed shaft Quite polluting environment and/or outdoor **Low speed shaft double seal** Quite polluting environment and/or outdoor	 Supplementary description when ordering by **designation**: **double seal on high speed shaft**. **double seal on low speed shaft**.
High speed shaft seal with labyrinth and grease feeder («taconite») Very polluting environment (e.g.: mining industry)	 It may not be always available in the bevel helical design with fan. Please consult us. Supplementary description when ordering by **designation**: **high speed shaft seal with labyrinth and grease feeder.**
Low speed shaft double seal with labyrinth and grease feeder («taconite») Very polluting environment (e.g.: mining industry) 1)	 Supplementary description when ordering by **designation**: **low speed shaft seal with labyrinth and grease feeder.**

Gear reducer size	A 2)		B Ø	C nr.2
400, 401	9	19	328	G ¼"

1) The labyrinth disc overhangs from A dimension and from shaft shoulder; the working length of low speed shaft end will be therefore equal to E - A (for dimension C and E see ch. 26 and 28); for dimension Z see ch. 30 (1), (3).

2) Values valid for hollow shaft (with keyway or shrink disc).

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

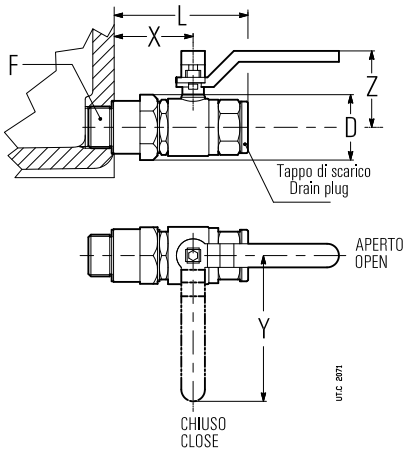
(27) Magnetic plug

Oil drain magnetic plug in order to reduce lubricant pollution and to increase the maintenance intervals.

In presence of oil drain tap (28) the oil drain magnetic plug is mounted in a second drain hole on housing and not in the tap.

Additional description when ordering by **designation**: **oil drain magnetic plug**.

(28) Oil drain tap

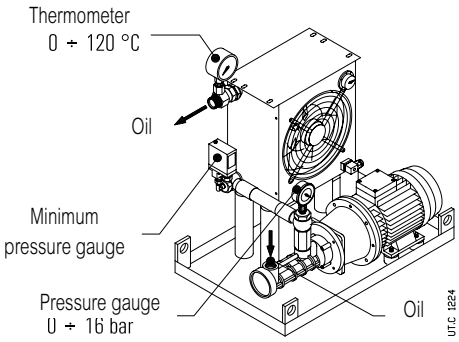


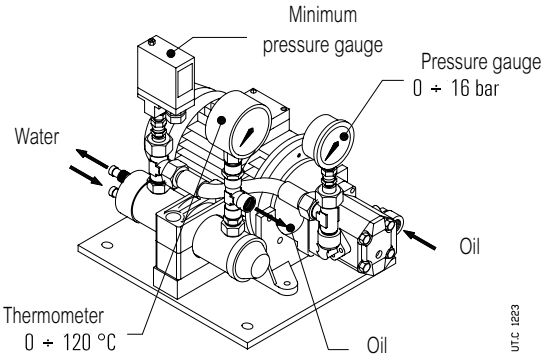
Gear reducer size	F	D Ø	L ≈	X	Y	Z
400, 401	G 1"	46	106	66	115	60

Accessory supplied already fitted.

Additional description when ordering by **designation**:
oil drain tap

(29) Independent cooling unit





Additional cooling device in the event that the other forced cooling systems are not sufficient anymore for the dissipation of thermal power produced by gear reducer during operation (see ch. 22).

Including:

- a **oil/air heat exchanger** O/A; with thermostat 32 - 194 °F (0 ÷ 90 °C) or **oil/water** (O/W);
- one **motor pump**: screw pump with fluoro rubber seals (gear pump for UR O/W 5hp ÷ UR O/W 28hp); 4 pole motor B3/B5 (three-phase 230 Y400 V 50 Hz); motor-pump connection with coupling;
- a **motor fan** (O/A) (three-phase supply 230 Y400 V 50 Hz or single phase supply 230 V 50, 60 Hz, see table on following page); 2-poles motor (UR O/A 7hp and 9hp) and 4-poles motor (UR O/A 13hp ... 62hp);
- one **analog manometer** 0 - 250 psi (0 ÷ 16 bar) mounted between pump and exchanger;
- one **analog thermometer** 32 - 250 °F (0 ÷ 120 °C) mounted at exchanger output;
- one **minimum pressure gauge** (with exchange contacts) mounted between pump and exchanger;
- one **supporting frame** with nameplate.

On request, several accessories are at disposal (supplied separately, assembly is Customer's responsibility) in order to satisfy all functionality and safety needs.

- **oil temperature probe Pt100**;
- **2-threshold signalling device CTN03** (necessary also the oil temperature probe Pt100) for the mounting to DIN EN 50022;
- **3-threshold signalling device CTN10** (necessary also the oil temperature probe Pt100) for the mounting to DIN EN 50022;
- **bi-metal type thermostat**;
- **flow gauge**;
- **filter** (with optical-electric blockage warning and one or two breathers M60).

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

30 - Accessories and non-standard designs

Connections realized by flexible pipes (type SAE 100 R1, maximum length 6.56 ft) between gear reducer and cooling unit and the assembly of accessories and signalling devices are Buyer's responsibility.

For the heat exchanger power required by the independent cooling unit:

$$P_S \geq (P_1 - Pt_N \cdot ft_1 \cdot ft_2 \cdot ft_3 \cdot ft_4 \cdot ft_5) \cdot (1 - \eta) \cdot K_1$$

where:

P_S nominal power of unit [hp], i.e. the power dissipable with hot oil at approx. 176 °F (80 °C) and cooling air at 104 °F (40 °C) (O/A) or cooling water at 68 °F (20 °C) (O/W) with stated capacity (see following table);

P_1 power at gear reducer input [hp] (consider the power installed when being uncertain about the power absorbed).

Pt_N nominal thermal power of gear reducer [hp] (see ch. 22);

ft_1 thermal factor according to input speed (see ch. 22);

ft_2 thermal factor according to ambient temperature (see ch. 22);

ft_3 thermal factor according to mounting position (see ch. 22);

ft_4 thermal factor according to altitude (see ch. 22); for UR O/A it is necessary to derate also the exchanger power: multiply P_S by 0.85 (by 3 300 - 8 200 ft above sea level) or by 0.71 (by 8 200 - 16 400 ft above sea level);

ft_5 thermal factor according to air speed on the housing (see ch. 22);

η gear reducer efficiency (see ch. 24);

$K_1 = 1{,}18$ takes into account the decrease of the exchanger efficiency due to dirt on the external surface

Oil/air unit (UR O/A)

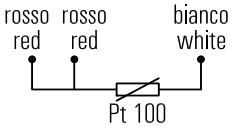
Supplementary description when ordering by **designation**:

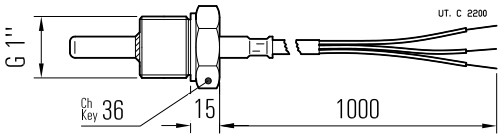
independent oil-air cooling unit UR O/A ... or **independent oil-air cooling unit UR O/W ...**, possibly integrated, when required by the application, with the description: «**Forced lubrication …**» and the statement of bearings and/or gears to be lubricated.

For dimensions, accessories, **low temperature starting** and further technical details, see specific documentation.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(30) Oil temperature probe





Remote oil temperature gauge; installation instead of drain plug, or into a hole properly pre-arranged by the Buyer. The temperature gauge is realized with a thermo-resistor Pt100 having following features:

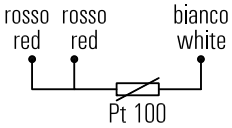
- platinum wire with 100 Ω at 32 °F (0 °C) according to EN 60751;
- precision class B according to EN 60751;
- operation temperature field -40 °F - +392 °F (-40 °C - 200 °C);
- max current 3 mA;
- 3 wire connection according to IEC 751 (see fig. on the top);
- stainless steel probe AISI 316; diameter 6 mm;
- cable 1 m long with free end.

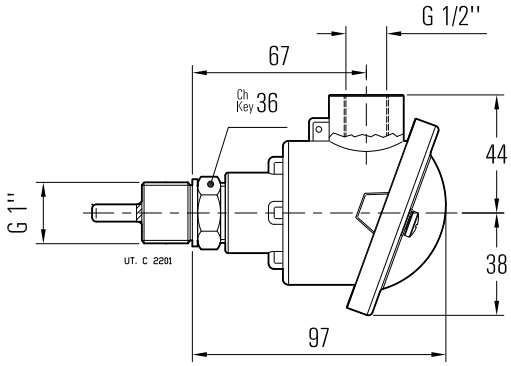
For the connection of probe to relevant signalling device CT03 or CT10 (on request, consult us) use a protected section cable ⩾ 1,5 mm^2 positioned separately from power cables.

In case of gear reducer supplied **filled with oil** foresee the probe equipped with **immersion bulb** (pre-mounted in the factory), its position is to be agreed with Rossi; consult us.

Supplementary description when ordering by **designation**: **oil temperature probe**.

(31) Oil temperature probe with terminal box and amperometric transducer 4 ÷ 20 mA





Remote oil temperature gauge, with terminal box and amperometric transducer; installation instead of drain plug, at Buyer's responsibility. The temperature gauge is realized with a thermo-resistor Pt100 having following features:

- platinum wire with 100 Ω at 0 °C according to EN 60751;
- precision class B according to EN 60751;
- operation temperature field -40 °F - +392 °F (-40 °C - 200 °C);
- 3 wire connection according to IEC 751 (see fig. on the top);
- stainless steel probe AISI 316; diameter 6 mm;
- amperometric transducer with output signal 4 - 20 mA;
- alluminium terminal block (supplied without cable gland);
- IP65 protection;
- input cables G ½";

For the connection of probe to relevant signalling device CT03 or CT10 (on request, consult us) use a protected section cable ⩾ 1,5 mm^2 positioned separately from power cables.

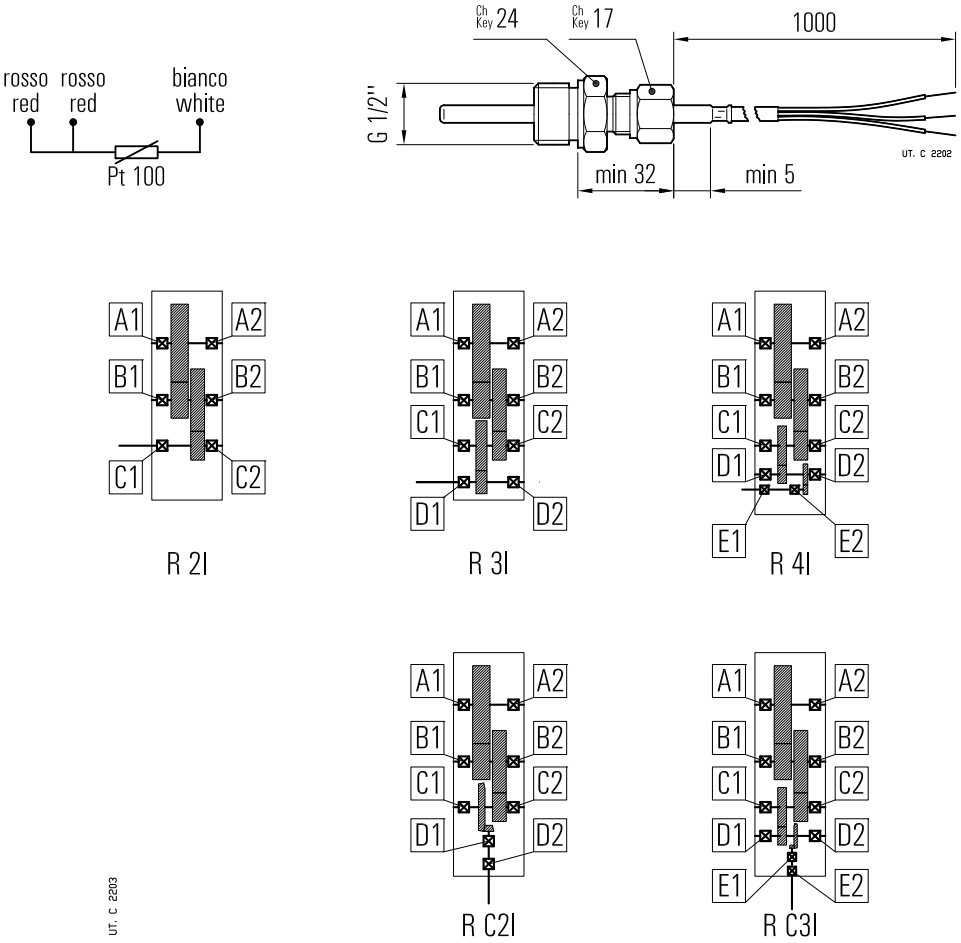
ATTENTION. Accessory available only after technical feasibility evaluation by Rossi: consult us.

In case of gear reducer supplied **filled with oil** foresee the probe equipped with **immersion bulb** (pre-mounted in the factory), its position is to be agreed with Rossi; consult us.

Supplementary description when ordering by **designation**: **oil temperature probe with amperometric transducer.**

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(32) Bearing temperature probe



Probe for the remote monitoring of bearing temperature; installation (Buyer's responsibility) in a hole properly pre-arranged, next to a bearing **to be agreed during order phase** (for the most common cases, in order to facilitate the identification of bearing to be monitored, refer to following scheme).

The temperature gauge is realized with a thermo-resistor Pt100 having following features:

- platinum wire with 100 Ω at 0 °C according to EN 60751;
- precision class B according to EN 60751;
- operation temperature field -40 °F - +392 °F (-40 °C ÷ 200 °C);
- max current 40 mA;
- 3 wire connection according to IEC 751 (see fig. on the top);
- stainless steel AISI 316 flat probe; diameter 6 mm;
- stainless steel **sliding** steel .
- cable 1 m long with free end.

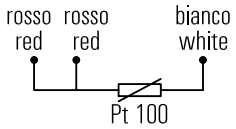
For the connection of probe to relevant signalling device CT03 or CT10 (on request, consult us) use a protected section cable ⩾ 1.5 mm^2 positioned separately from power cables.

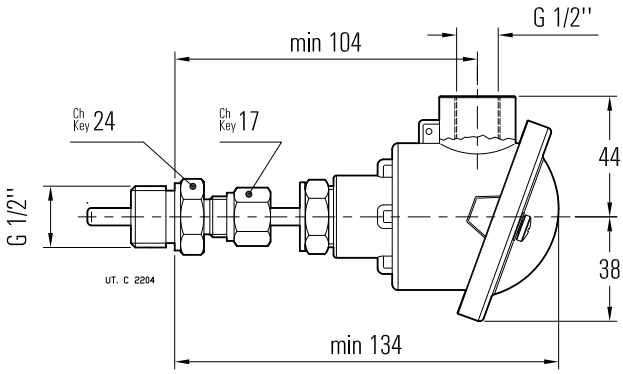
ATTENTION. Accessory available only after technical feasibility evaluation by Rossi: consult us.

Supplementary description when ordering by **designation**: **bearing temperature probe**

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(33) Bearing temperature probe with terminal box and amperometric transducer 4 ÷ 20 m





Probe for remote bearing temperature monitoring, with terminal box and amperometric transducer; installation (at Buyer's responsibility) in a threaded hole properly pre-arranged next to a bearing **to be agreed when ordering** (for the most common cases, in order to facilitate the identification of the bearing to be monitored, it is possible to refer to the scheme at (32)).

The temperature gauge is realized with a thermo-resistor Pt100 having following features:

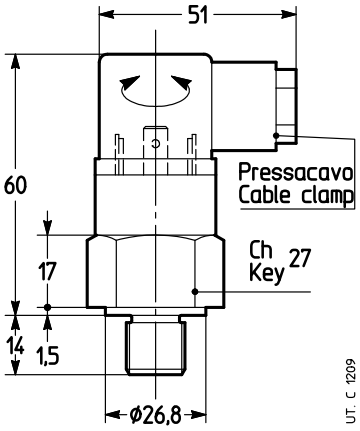
- platinum wire with 100 Ω at32 °F (0 °C) according to EN 60751;
- precision class B according to EN 60751;
- operation temperature field -40 °F - +392 °F (-40 °C ÷ 200 °C);
- 3 wire connection according to IEC 751 (see fig. on the top);
- amperometric transducer with output signal 4 ÷ 20 mA;
- alluminium terminal block (supplied without cable gland);
- IP65 protection;
- input cables G ½";
- stainless steel AISI 316 flat probe; diameter 6 mm;
- stainless steel **sliding** steel .
- cable 1 m long with free end.

For the connection of probe to relevant signalling device CT03 or CT10 (on request, consult us) use a protected section cable ⩾ 1,5 mm² positioned separately from power cables.

ATTENTION. Accessory available only after technical feasibility evaluation by Rossi: consult us.

Supplementary description when ordering by **designation**: bearing temperature probe with **amperometric transducer.**

(34) Bi-metal type thermostat



Bi-metal type thermostat for the control of the maximum admissible oil temperature.

Thermostat specifications:

- NC contact with maximum current 10 A 240 V a.c. (5 A - 24 V d.c.);
- G 1/2" thread connection;
- Pg09 DIN 43650 cable cland;
- IP65 protection;
- setting temperature 194 °F ± 41 °F (90 °C ± 5 °C) (other setting temperatures are possible, on request);
- differential temperature 59 °F.

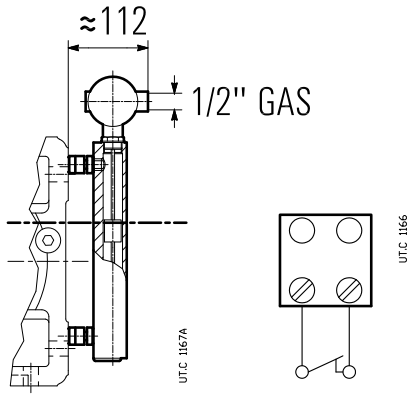
Mounting into a threaded plug (position to be defined according to mounting position and mounting arrangement: consult us) and oil bath lubrication is Buyer's responsibility.

ATTENTION. Accessory available only after technical feasibility evaluation by Rossi: consult us.

Supplementary description when ordering by **designation**: **bi-metal type thermostat**.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

(35) Oil level switch with float



It is a level control device with reed contacts in a supporting stem moved by the magnetic field activated by the magnets included in the float.

The float and the supporting stem are included in a hollow column of not magnetic material connected to the gear reducer housing through communicating vessels.

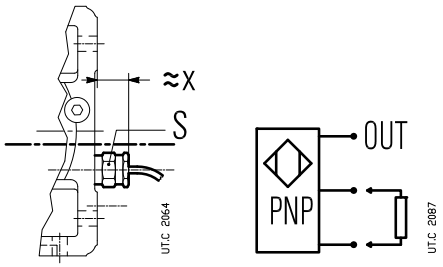
Connecting features:
- 2 wires connection;
- maximum voltage: 350 V
- maximum current: 1.5 A
- 1 cable input 1/2" UNI 6125 – IP65;
- G 1" brass joint.

The switch is supplied ready for use; when level goes down approx 5 mm, the switch goes on and contact opens.

When filling oil in the gear reducer it is necessary to verify that device is properly calibrated. If any problems occur during this operation contact Rossi.

ATTENTION. Accessory available only after technical feasibility evaluation by Rossi S.p.A.: consult us.
Supplementary description when ordering by **designation: oil level switch with float**

(36) Oil optical probe



Optical scanner, without mobile parts, for the constant control of oil level, inside the gear reducer at rest (e.g. control before starting the machine or the plant).

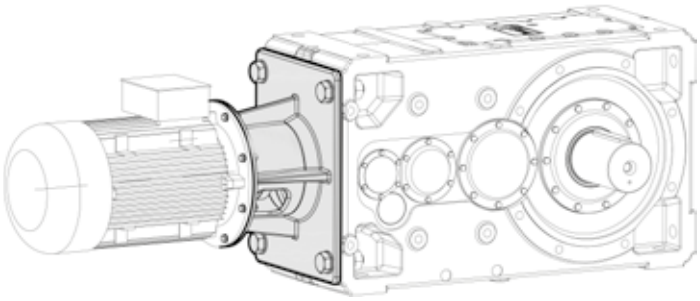
Features:
- Stainless steel probe.
- operation temperature range -40 °F - 257 °F (-40 °C ÷ 125 °C);
- d.c. supply 12 ÷ 28 V (other types on request; consult us);
- PNP output (other types on request, consult us), max 100 mA;
- G 1" thread connection;

Supplementary description when ordering by **designation**: **oil optical probe.**

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

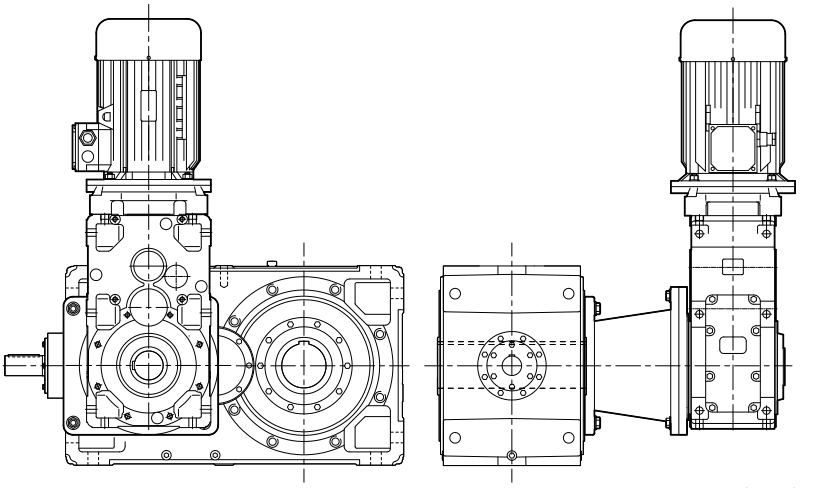
Miscellaneous

– Motor bell housings



Nodular cast iron bell housing for eletric motor-gear reducer connection through flexible coupling. Available for motor size IEC 100 ... 400; on request also with NEMA motor coupling dimensions.

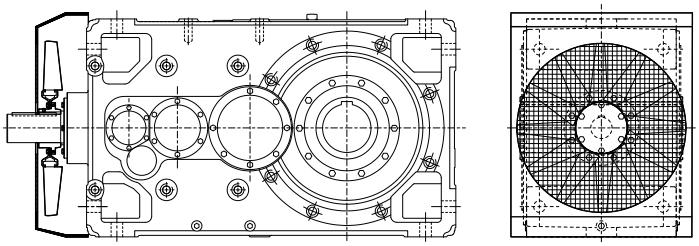
– Auxiliary drive

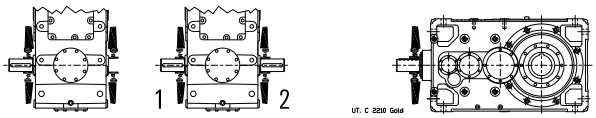


UT.C 2209_Gold

Additional motor drive with bevel helical gearmotor, trains of gears CI, ICI, C2I, connected with main gear reducer through bell, coupling and free wheel.

– Axial fan cooling

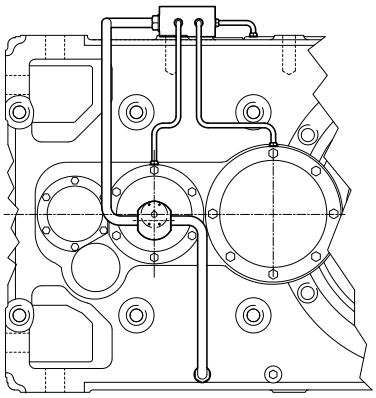




Forced cooling by axial fan for applications with one direction of rotation only (to be specified when ordering); for thermal factor values $f_{t_{1b}}$ see ch. 22. The possible designs are those illustrated below. Dimensions on request: consult us.

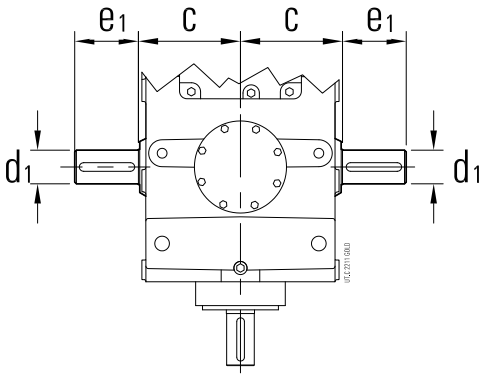
Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

– Pump driven by gear reducer



External gear pump driven directly by a gear reducer high speed shaft for the forced lubrication of bearings and/or gears. Self-priming operation, with non-return valve, single acting (one-way applications) or double-acting (bidirectional applications); absence of electrical power; flow rate proportional to the shaft rotational speed of the gear unit. Dimensions and other specifications, on request: consult us.

– Additional intermediate shaft overhung for bevel helical gear reducers



Train of gears	u_{N1} 1)	Nominal transmission ratio i_N	Shaft end dimensions c	d_1 Ø	e_1
C2I	**2**	$i_N \leq 25$	335	90	170
	2,5	$28 \leq i_N \leq 40$			
	3,15	$45 \leq i_N \leq 50$			
	4	$56 \leq i_N \leq 80$			
	5	$i_N \geq 90$			
C3I	**2**	–	325	65	140
	2,5	$i_N = 125$			
	3,15	$160 \leq i_N \leq 200$			
	4	$i_N \geq 250$			
	5	–			

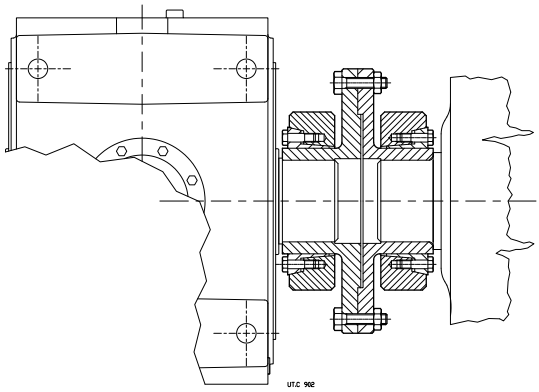
1) Nominal transmission ratio of first reduction stage.

Bevel helical gear reducers can be equipped with a (single or double) shaft overhung on wheel shaft of first reduction stage (bevel wheel) in order to allow the realization of combined units or the application of auxiliary devices (i.e.: external backstop device). Main dimensions of shaft end as per following table (for other dimensions see ch. 24).

In the table are stated the nominal transmission ratios of first reduction stage – according to total transmission ratios – with which it is possible to calculate the rotation speed of the auxiliary overhung.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

– Low speed shaft with flange coupling for shaft mounting arrangements



Low speed cylindrical shaft without keyway for application of a flange coupling for drive unit shaft mounting.

– Pre-arrangement for vibration monitoring devices

Position, number and dimension of holes to be agreed when ordering.

– Gear reducer design ATEX II 2 GD and 3 GD (sizes 400, 401)

Helical and bevel helical gear reducers and gearmotors may be supplied according to Directive ATEX in order to be used in potentially explosive atmospheres – category **2 GD** (for operation in zones 1 (gas), 21 (dust): **probable** presence of explosive atmosphere) and **3 GD** (for operation in zones 2 (gas), 22 (dust): **improbable** presence of explosive atmosphere) – with surface temperature T 135 °C (T4).

These are the main variations of the product:

– fluoro-rubber seal rings;
– metal plugs; filler plug with filter and valve;
– special name plate with ATEX mark and indication of application limits;
– external protection based on a water-soluble dual-compound polyrethane **conductive** enamel, **color grey** RAL 7040, corrosivity class C3 ISO 12944-2;
– «ATEX instructions» manual.

For category **2 GD**[1)], depending on **minimum control intervals**, also:

2 GD monthly control

– double seal rings on low speed shaft;

2 GD quarterly control:

– double seal rings on low speed shaft;
– oil temperature probe;
– possible bearing temperature probes.

This solution is advisable when the gear reducer has difficult access or when a decrease in control frequency is desired.

Temperature range: -20 ÷ +104 °F (0 ÷ +40 °C) for gear reducers supplied with bearing lubrication pump.

The «**ATEX instructions**» (with the additional documentation, if any) are **integral part of the supply of each gear reducer**; every indication stated in it must be carefully applied. Consult us if need be.

Attention. In the following cases ATEX design of gear reducer is incompatible with accessories and non-standard designs:

Accessory or non-standard design	Gear reducer ATEX II design	
	2 GD	**3 GD**
Hollow low speed shaft with shrink disc (6)	●	●
Optional paint according to cycles 3H..., 2I..., 2L... (24)	○	○
Heater (25)	○	○
Independent cooling unit (29)	–	–
Oil temperature probes (30) (31)	○	○
Bearing temperature probes (32) (33)	○	○
Bi-metal type thermostat (34)	–	–
Oil level switch with float (35)	2)	●

– Not available.
● Available.
○ Available but in ATEX design suitable for gear reducer's ATEX design and for use purpose and area.
1) The presence of bearing lubrication pump requires one or more additional bearing temperature probes.
2) This accessory is available for category 2 G (zone 1) only.
3) When determining f_{t1} consider a value of f_{t1a} (see page 28) **never exceeding 1**.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Gear reducer size selection

Determine the size of gear reducer as indicated in ch. 5 considering following additional indications:

- **maximum input speed** $n_1 \leq$ **1 500 rpm**; for other input speed, consult us.
- **service factor required** determined as per ch. 3, increased by table correction factor fs_{ATEX} (see table 1) and anyway **never lower than 1**; in presence of a hollow shaft with shrink disc (6) verify that maximim peak torque is always lower than $T_{2SD} / f_{S\ ATEX}$ (for T_{2SD} values see ch. 17(6)).
- thermal power Pt verified as per ch. 4 according to nominal thermal power Pt_N increased by thermal factors ft_1 [1] ... ft_4 and ft_{ATEX} corrective factor(see table 1).

Table 1 - Corrective factors for ATEX design of service factor required and of nominal thermal power

Category	fs_{ATEX}	ft_{ATEX}
2 GD	1,18	0,8 (0,71 for I and CI)
3 GD	1,06	0,9 (0,8 for I and CI)

1) When determining ft_1 consider a value of ft_{1a} (see page 28) **never exceeding 1**

Supplementary description when ordering by **designation**[2]:

design ATEX II ...

... 3 GD T4

... 2 GD T4 monthly control

... 2 GD T4 quarterly control

2) This designation, in case of gearmotor, refers to the gear reducer part only.

31.1 - Safety

IMPORTANT: gear reducers and gearmotors supplied by Rossi are **components** and must be incorporated into machinery and **should not be commissioned before the machinery in which the components have been incorporated conforms to:**

- **Machinery directive 2006/42/EC and subsequent updatings; in particular, possible safety guards for shaft ends not being used and for eventually accessible fan cover passages (or other) are the Buyer's responsibility;**
- **«Electromagnetic compatibility (EMC)» 2004/108/EC and subsequent updatings.**

Attention! It is recommended to pay attention to all instructions of present handbook, all existing safety laws and standards concerning correct installation. Whenever personal injury or property damage may occur, foresee adequate supplementary protection devices against:

- **release or breakage of fastening screws;**
- **rotation or unthreading of the gear reducer from shaft end of driven machine following to accidental breakage of the reaction arrangement;**
- **the accidental breakage of shaft end of driven machine.**

If deviations from normal operation occur (temperature increase, unusual noise, etc.) immediately switch off the machine.

Installation

An incorrect installation, an improper use, the removing or disconnection of protection devices, the lack of inspections and maintenance, improper connections may cause severe personal injury or property damage. Therefore the component must be moved, installed, commissioned, handled, controlled, serviced and repaired **exclusively by responsible qualified personnel specifically instructed** and have the necessary experience to **recognize** any **risks** connected with present products avoiding any possible emergencies.

Gear reducers and gearmotors of present handbook are normally suitable for installations in industrial areas: additional protection measures, if necessary, must be adopted and assured by the personnel responsible for the installation.

Attention! Components in non-standard design or with special executions or with constructive variations may differ in the details from the ones described here following and may require additional information.

Attention! For the installation, use and maintenance of the **electric motor** of the possible motor-variator and/or the electric supply device (frequency converter, soft-start, etc.), and/or any optional electric devices (e.g.: independent cooling unit, etc.), consult the specific attached documentation.

If necessary, require it.

Maintenance

When operating on gear reducer or on components connected to it the machine must be at rest: disconnect motor (including auxiliary equipments) from power supply, gear reducer from load, be sure that safety systems are on against any accidental starting and, if necessary, pre-arrange mechanical locking devices (to be removed before commissioning).

Attention! During the running the gear reducers could have hot surfaces; Always wait that the gear reducer or the gearmotor to cool before carrying out any operations.

Further technical documentation can be downloaded from our website www.rossi.com.

31.2 - Application conditions and use limits

Gear reducers are designed for **industrial applications according to name plate data**, when no vibrations (permissible vibration velocity: v_{eff} < 0.012 ft/s for $P_1 \leq$ 20 hp, v_{eff} < 0.015 ft/s for P_1 > 20 hp), no nuclear radiations and important magnetic fields, with **ambient temperature -4 - +104 °F (-20 - +40 °C)** (with peaks at +122 °F, i.e. +50 °C), with air velocity ⩾ 4 ft/s, maximum altitude 3280 ft (1 000 m), and max relative humidity 80 % .

For continuative ambient temperature higher than 104 °F (40 °C) or lower than -4 °F (-20 °C) consult us.

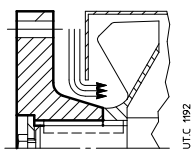
31.3 - General

Be sure that the structure on which gear reducer or gearmotor is fitted is plane, levelled and sufficiently dimensioned in order to assure fitting stability and vibration absence, keeping in mind all transmitted forces due to the masses, to the torque, to the radial and axial loads.

Position the gear reducer or gearmotor so as to allow a free passage of air for cooling both gear reducer and motor (especially at gear reducer and motor fan sides).

If there is fan on the gear reducer verify that there is sufficient space allowing for adequate circulation of cooling air also after fitting coupling protection. If a coupling protection is fitted, smooth the coupling hub, if necessary.

Avoid: any obstruction to the air-flow; heat sources near the gear reducer that might affect the temperature of cooling-air and of gear reducer for radiation; insufficient air recycle or any other factor hindering the steady dissipation of heat.



Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Mount the gear reducer so as not to receive vibrations.

When external loads are present use pins or locking blocks, if necessary.

When fitting gear reducer and machine it is recommanded to use **locking adhesives** such as LOCTITE on the fastening screws (also on flange mating surfaces).

For outdoor installation or in a hostile environment protect the gear reducer or gearmotor with anticorrosion paint. Added protection may be afforded by water-repellent grease (especially around the rotary seating of seal rings and the accessible zones of shaft end).

Gear reducers should be protected wherever possible, and by whatever appropriate means, from solar radiation and extremes of weather; weather protection **becomes essential** when high or low speed shafts are vertically disposed.

For ambient temperatures higher than 104 °F (40 °C) or lower than 32 °F (0 °C), consult us.

If overloads are imposed for long periods or if shocks or danger of jamming are envisaged, then motor-protection, electronic torque limiters, fluid couplings, safety couplings, control units or other similar devices should be fitted.

Attention! Bearing life, good shaft and coupling running depend on alignment precision between the shafts. Carefully align the gear reducer with the motor and the driven machine (with the aid of shims if need be), interposing flexible couplings whenever possible.

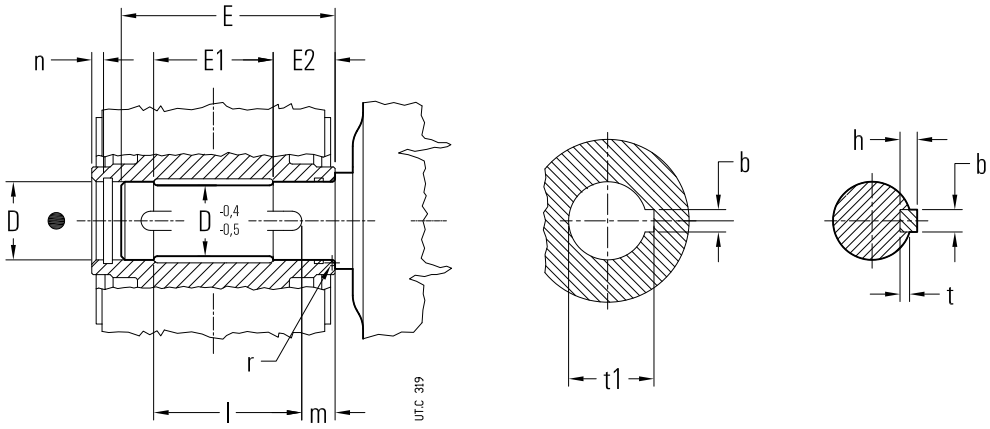
Whenever a leakage of lubricant could cause heavy damages, increase the frequency of inspections and/or envisage appropriate control devices (e.g.: remote oil level gauge, lubricant for food industry, etc.).

In polluting surroundings, take suitable precautions against lubricant contamination through seal rings or other.

31.4 - Shaft machine of driven machine

Dimensions of **machine shaft end**, which the gear reducers's hollow shaft is to be fitted to, are those recommended in the table and shown in the figure.

Important: the shoulder diameter of the driven machine shaft end abutting with the gear reducer must be at least **(1,18 - 1,25) · D.**



Gear reducer size	Hollow shaft		Shaft end of driven machine						Parallel key	Keyway		
	D	**n**	**E**	**E_1**	**E_2**		**m**	**r**	**b × h × l**	**b**	**t**	**t_1**
	Ø H7 / h6, j6		2)		2)	1) 2)			h9 h11	$H9_{hub}$ $N9_{shaft}$	shaft	hub
400, 401	200	14	620	300	165	130	10	5	45 × 25 × 600	45	15	210,4

1) Values valid for **R 4I**.

2) In presence of «Low speed shaft seal with labyrinth and grease feeder» (ch. 30 (26)) it is necessary to increase the dimension E (E2) of quantity A stated in the table on ch. 30 (26).

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

31.5 - Mounting of components on high and low speed shaft

Generally, it is recommended to machine the hole of parts keyed onto shaft end, tolerance H7. For high speed shaft end with D ⩾ 55mm, tolerance can be G7, provided that load is uniform and light. Further data according to the table «High and low speed shaft end» (ch. 24).

Before mounting, thoroughly clean mating surfaces with proper antirust products, and lubricate against seizure and fretting corrosion.

With hollow low speed shaft with **shrink disc on machine opposite side** it is necessary to protect the cylindrical portion of machine shaft end on **shrink disc opposite side** using adequate products against fretting corrosion.

Installation and removal operations should be carried out with the aid of jacking screws and pullers using the tapped hole at the shaft butt-end (see table in fig. 2) taking care to avoid impacts and shocks which may irreparably damage the bearings, the circlips or other parts or cause sparks; for H7/m6 and K7/j6 fits it is advisable that the part to be keyed is preheated to a temperature of 176 - 212 °F (80 - 100 °C).

The couplings having a tip speed on external diameter up to 66 ft/s must be statically balanced; for higher tip speeds they must be dynamically balanced.

Where the transmission link between gear reducer and machine or motor generates shaft end loads, ensure that: loads do not rise above catalog values:

– loads do not rise above the values stated at ch. 29 and loads do not rise above the values of the application design;
– transmission overhang is kept to a minimum;
– drive-chains should not be tensioned (if necessary – alternating loads and/or motion – foresee suitable chain tighteners); if the peripheral speed of the chain is greater than 3.3 ft/s it is necessary to install proper malfunction markers such as aligning sensors, etc.
– in the gear transmission there is an adequate gear mesh (≈ 0,03 - 0,04 · m) between pinion and rack (bushing).
– drive-belts should not be over-tensioned.

For splined couplings apply adequate products against oxydation.

31.6 - Hollow low speed shaft

In order to have an easier installing and removing, proceed as per the drawings a, b, respectively.

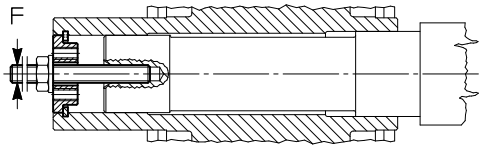
For the axial fastening it is possible to adopt the system as per fig. c, d. When shaft end of driven machine has no shoulder, a spacer may be located between the retaining ring and the shaft end itself.

The machine shaft end must be as stated at ch. 31.4 (ch. 30 (5) and 30 (6) in case of stepped hollow low speed shaft or shrink disc). For vertical ceiling-type mounting, contact us.

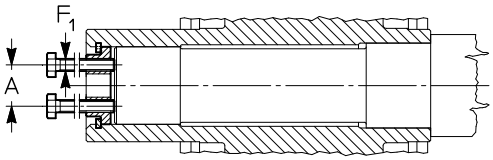
On request it is possible to supply (ch. 30 (20)) a washer for the mounting, disassembling and the axial fastening of gear reducer. Parts in contact with the retaining ring must have sharp edges. When tightening the bolt, we recommend the use of a locking adhesive LOCTITE 601.

Whenever **personal injury** or **property damage** may occur, foresee **adequate supplementary protection devices against**:

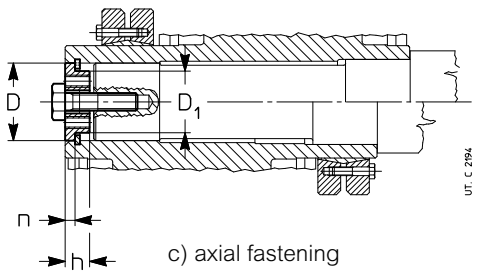
– **the rotation or unthreading of gear reducer** from machine shaft end following to accidental breakage of the reaction arrangement;
– **accidental breakage of shaft end of driven machine.**



a) installing



b) removing



c) axial fastening

Gear reducer size	A		D		D_1		F	F_1	h	n	Bolt for axial fastening UNI 5737-88

1) Dimension valid for design with hollow low speed shaft with keyway.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

31.7 - Lubrication

Gear pairs are oil-bath lubricated.

Bearings are either oil-bathed or splashed with the exception of the top bearings which are lubricated with a pump (see ch. 30 (19)) or lubricated «for life» with grease (with or without NILOS ring according to speed).

Gear reducers are supplied **without oil**; before putting into service, fill to the specified level with **mineral oil** with **EP** (extreme pressure) **additives**, having the ISO viscosity grade given in the table, according to ambient temperature and output speed. Under normal conditions the first and the second speed range are for train of gears **2I**, the third is for trains of gears **3I**, **4I**, **C2I**, **C3I** and the fourth is for particular applications.

When it is required to increase oil change interval («long life»), the ambient temperature range, and/or to reduce oil temperature, use PAO polyalphaolefine based **synthetic oil** with **EP** (extreme pressure) **additives**, having ISO viscosity grade as indicated in the table.

For continuous duty, the use of synthetic oil is recommended in the following case of gear reducers with size and mounting position marked with (see ch. 26, 28) and bevel helical gear reducers with double extension high speed shaft. An overall guide to oil-change interval is given in the table, and assumes pollution-free surroundings. When heavy overloads are present, halve the values.

Apart from running hours:
— replace mineral oil at least each 3 years;
— replace or regenerate synthetic oil each 5 ÷ 8 years according to gear reducer size, running and environmental conditions.

Never mix different makes of synthetic oil; if oil-PAO polyalphaolefine based **synthetic oil** with **EP** (extreme pressure) **additives**, change involves switching to a type different from that used hitherto, then give the gear reducer a through clean-out.

Seal rings: duration depends on several factors such as dragging speed, temperature, ambient conditions, etc.: as a rough guide, it can vary from 3 150 to 25 000 h.

ISO viscosity grade

Warning: before unscrewing the filler plug with valve (symbol) wait until the unit has cooled and then open with caution.

31.8 - Gear reducer starting at low ambient temperature ($T_{amb} = T_{oil}$ ⩽ 77 °F (25 °C))

The **minimum** ambient temperature (matching with the oil temperature) to which it is allowed to start the gear reducer depends from lubrication system and from lubricant type.

Gear reducers with splash lubrication

The gear reducer can be started with oil/ambient temperature ⩾ - 4 °F (- 20 °C), keeping in mind to follow all lubricant viscosity instructions as per previous paragraph («Lubrication»).

In presence of an eventual independent cooling unit with heat exchanger (but without forced lubrication), it is necessary to start the motor pump when achieving the oil temperature of 140 °F (60 °C).

Gear reducers with forced bearing lubrication

In presence of forced bearing lubrication systems (s. ch. 24 and ch. 30 (8) and (9)), the gear reducer can be started only if oil temperature is ⩾ 77 °F (25 °C), respecting all lubricant viscosity instructions as per ch. 31.6.

Therefore, before starting the gear reducer it is necessary to preheat the oil bath using heaters (see ch. 30 (10)) up to achieving a temperature of 77 °F (25 °C).

1) Peaks of 18 °F (10 °C) below and 18 °F (10 °C) above the ambient temperature range are acceptable. For the running at **low temperature starting** ($T_{amb} = T_{oil}$ ⩽ 77 °F (25 °C)) and **forced lubrication**, **foresee always the heater** of **oil pre-heating** (see ch. 31.7).
2) Values admitted only for non continuous duty.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

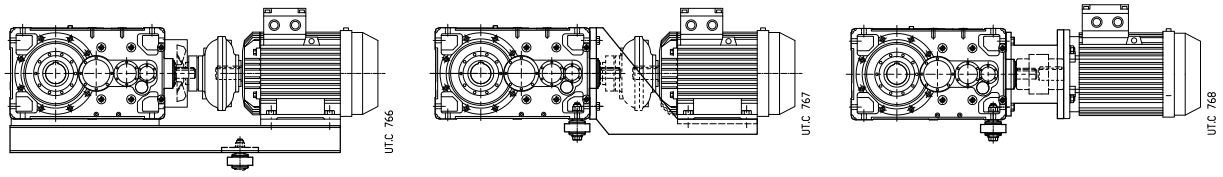
31.9 - Shaft mounting arrangements

The strength and shape of the housing offer **advantageous** possibilities for shaft mounting even – for instance – in the case of gearmotor with belt drive, hydraulic coupling, etc.

A few possible examples of shaft mounting arrangements are shown.

IMPORTANT. When shaft mounted, the gear reducer must be supported both axially and radially (also for mounting positions B3 ... B8) by the machine shaft end, as well as anchored against rotation only, by means of a reaction having **freedom of axial movement** and **sufficient clearance** in its couplings to permit minor oscillations always in evidence without provoking dangerous overloading on the gear reducer. Lubricate with proper products the hinges and the parts subject to sliding; when mounting the screws it is recommended to apply locking adhesives type LOCTITE 601.

In case of axial fastening with elastic constraint, in B3 or B8 mounting position, ensure that housing oscillation while running does not exceed the perfectly horizontal position.



Semi flexible and economic reaction arrangement (see ch. 30.7): with bolt using disc springs.

31.10 - Tightening torque

Unless otherwise stated, usually it is sufficient to use screws in class 8.8;

Before tightening the bolt be sure that the eventual centering of flanges are inserted properly

In general, the bolts are to be diagonally tightened with the maximum tightening torque.

The bolts of shrink disc must be gradually and uniformly tightened, with continuous sequence (not diagonally!) and in several phases up to the reaching of maximum tightening torque.

Before tightening, carefully degrease the screws; in the event of heavy vibrations, heavy duties, frequent drive inversions apply a proper thread-locking sealant Loxeal 23-18 or equivalent.

32 - Drive units on swing base

Specifications

Drive units are composed of an **electric motor** and a **right angle shaft gearbox** both in B3 mounting position (horizontal shafts), assembled on a **swing base** made of electrically-welded and annealed steel properly sized, and connected through a coupling.

The **coupling** can be of different types: flexible, basic hydraulic, or hydraulic with simple or double delayed fill chamber. Both types of coupling can be supplied with drum pulley for **failsafe shoe brake**. On request the option with disc brake is also available.

Both the coupling and the safety or parking brake (if any) are protected with a steel **guard** fixed to the swing base.

The swing base includes the reaction point with elastic bush for shaft-mounting. The **reaction point**, complete with screws kit for fixing to the swing base, is supplied separately, and assembling is up to Customer.

Drive unit painting is realized with synthetic paint suitable for resistance to normal industrial environments, and for the application of further coats of synthetic paint; final colour blue RAL 5010 DIN 1843.

Gear reducer

The right angle shaft gear reducer belongs to the standard Rossi production program, characterized by:

- Manufacturing and product management flexibility
- High manufacturing quality standard
- High, reliable and tested performances
- Wide range of sizes and trains of gears in order to meet Customer and application needs
- Strength, accuracy and reliability enhanced through modern design, manufacturing and operating criteria
- Reduced maintenance

Performance, dimensions and design features can be found on the relevant pages of this catalog.

All the gearboxes are designed to transmit high nominal and maximum output torque, and to withstand high external loads.

The standard arrangement for this type of drive units is shaft mounted, with gearbox with hollow low speed shaft. Connection between gearbox and machine shaft is possible with keyway or shrink disc. On request it is possible to supply covers for rotating parts.

As alternative the option for shaft mounting with solid cylindrical low speed shaft, complete with rigid flanged coupling, is available.

For further details about dimensions, matching features and available options please refer to specific catalogs.

Swing base

The swing base structure is made of hollow profiles (gearbox sizes 140 ... 225) or beams (gearbox sizes 250 ... 360), appropriately combined, treated and machined.

The project is made to maximize the swing base strength, in order to optimize costs and performance.

All swing bases have been verified for bending, considering the highest load condition among the ones foreseen on this catalog.

On each swing plate there are machined surfaces for fitting and jacking screws for alignment of the components of the drive unit. All Rossi components are supplied already assembled and aligned on the swing base.

The matching point for the reaction arm has been defined in order to optimize the swing base fixing, so to minimize the stress on swing base and transmission components.

The standard supply includes the reaction point with elastic bush supplied separately (assembly is up to Customer). If necessary the complete reaction arm can be quoted and supplied, subject to agreement with Customer about characteristics and dimensions.

Courtesy of Steven Engineering, Inc - (800) 258-9200 - sales@steveneng.com - www.stevenengineering.com

Selection

The motor - gear reducer combinations have been made considering a minimum service factor 1,4. For further details about the relation between service factor, nature of load and life time of the gear reducer please refer to the selection tables of this catalog.

In any case **gear reducer selection has to be realized according to descriptions and prescriptions contained in Rossi catalogs for each specific application.**

Dimensions and masses

In order to calculate the overall dimensions of the drive unit first of all it is necessary to identify type and size of the transmission components.

The drive unit has been considered as composed of two sub-groups:

- **motor sub-group**, including electric motor, coupling with brake drum (if any), brake (if any) and protection guard for coupling and brake
- **gear reducer sub-group**, including gear reducer and swing base with reaction point

From page 460 to page 463 the motor sub-group dimensions can be found in all the available options, according to coupling type, size and type of motor.

From page 464 to page 467 the gear reducer sub-group dimensions can be found, according to train of gears and gear reducer size, and considering a possible fan fitted on the gearbox high speed shaft.

In same case, according to motor number of poles and to nominal supply frequency, a different choice of the hydraulic coupling becomes necessary and therefore A dimensions change consequently; details are given at page 468.

The dimensional data reported in the above mentioned two sections, combined according to picture below, allow the complete identification of the drive unit overall dimensions.

The masses stated in the dimensional tables, in both motor and gear reducer subgroups separately, are indicative, and then the total drive unit mass has to be considered only as a reference to identify the suitable and needed tools to lift the complete drive unit. **We strongly recommend to size the lifting tools with a safety margin of 25% in relation to the indicative value reported on the catalog.** Concerning the lifting please follow instructions given on page 470.

1) Dimensions are valid also with shoe brake.
2) For L dimension see page 461 (motor subground).
3) With fan cooling.
4) Dimensions to be checked at page 468 according to train of gear and power supply.
5) Working length of thread 2·M.
6) In case of seals protected with labyrinth cover and greaser Z dimensions can be increased up to 15 mm, according to gea reducer size, consult us.
7) Masses are indicative. In order to obtain the total mass of the drive unit add the mass relative to the motor sub-group.

Accessories

Reaction point with elastic bush

Before mounting accurately clean the mating surfaces and provide a roughness sufficiently high to ensure a proper friction coefficient; if necessary, remove by a scraper or solvent the possible paint from the mating surfaces.

Fasten the screws with a dynamometric wrench to the tightening torque given in the table; check the tightening torque after the first running period and then at regular intervals.

It is recommended to use locking adhesives (such as LOCTITE) on the fastening screws and mating surfaces.

Installation and maintenance

The drive unit is supplied complete with the relevant Installation and Maintenance Instructions for all the components of the drive unit.

Gear reducer are supplied without oil. For quantities and type of oil, as well as oil change intervals, please follow the relative catalog instructions or in the gear reducers Installation and Maintenance manual.

Hydraulic couplings are supplied without oil. For quantities and type of oil please follow the relevant catalog instructions or in the specific Installation and Maintenance manual.

Lifting

Lift the drive unit through the lifting points as shown on fig. 1a, using chains or lifting streps.

The drive unit is supplied including no.2 lifting lugs fitted on the gear reducer, while the lifting bar is up to Customer.

We strongly recommend to size the lifting tools with a safety margin of 25% with respect to the total mass given on the catalog and/or on the nameplate of the drive unit.

Miscellaneous

Drive unit with:

- **Special painting** for hard ambient conditions,consult us
- **Torque arm**: features and dimensions to be agreed with the Customer
- Gearmotor arrangements made by means of **bell housing and elastic coupling** are available for all gearbox sizes
- **Emergency units** including auxiliary drives connected to the main drive unit
  Different types of gear units can be used as auxiliary drive and connected directly to the main drive through a freewheel or an overrunning clutch which allows to keep the second drive idle during normal running
- **External belt drives**, together with motor support
- **Electromagnetic clutch**
- **Positive brakes**
- **All-steel couplings**
- **Gear couplings**, standard or disengageable type
- Torque limiters
- **Arrangement according to ATEX II 2GD and 3GD**, with necessary accessories for control and setting
- **Swing base for fixing to ground**

Technical formulae

Main formulae concerning mechanical drives, according to the Technical System and International Unit System (SI).

Size	With Technical System units	With SI units
starting or stopping **time** as a function of an acceleration or deceleration, of a starting or braking torque	$t = \frac{Gd^2 \cdot n}{375 \cdot M}$ [s]	$t = \frac{J \cdot \omega}{M}$ [s]
velocity in rotary motion	$v = \frac{\pi \cdot d \cdot n}{60} = \frac{d \cdot n}{19,1}$ [m/s]	$v = \omega \cdot r$ [m/s]
speed	$n = \frac{60 \cdot v}{\pi \cdot d} = \frac{19,1 \cdot v}{d}$ [min^{-1}]	$\omega = \frac{v}{r}$ [rad/s]
acceleration or deceleration as a function of starting or stopping time	$a = \frac{v}{t}$ [m/s^2]	
angular acceleration or deceleration as a function of a starting or stopping time, of a starting or braking torque	$\alpha = \frac{n}{9,55 \cdot t}$ [rad/s^2] $\alpha = \frac{39,2 \cdot M}{Gd^2}$ [rad/s^2]	$\alpha = \frac{\omega}{t}$ [rad/s^2] $\alpha = \frac{M}{J}$ [rad/s^2]
starting or stopping **distance** as a function of a starting or stopping time, of a starting or braking velocity	$s = \frac{v \cdot t}{2}$ [m]	$s = \frac{a \cdot t^2}{2}$ [m]
starting or stopping **angle** as a function of an angular acceleration or deceleration, of a final or initial angular velocity	$\varphi = \frac{\alpha \cdot t^2}{2}$ [rad] $\varphi = \frac{n \cdot t}{19,1}$ [rad]	$\varphi = \frac{\omega \cdot t}{2}$ [rad]
mass	$m = \frac{G}{g}$ $[\frac{kgf\ s^2}{m}]$	m is the unit of mass [kg]
weight (weight force)	G is the unit of weight (weight force) [kgf]	$G = m \cdot g$ [N]
force in vertical (lifting), horizontal, inclined motion of translation (μ = coefficient of friction; φ = angle of inclination)	$F = G$ [kgf] $F = \mu \cdot G$ [kgf] $F = G\ (\mu \cdot \cos \varphi + \text{sen}\ \varphi)$ [kgf]	$F = m \cdot g$ [N] $F = \mu \cdot m \cdot g$ [N] $F = m \cdot g\ (\mu \cdot \cos \varphi + \text{sen}\ \varphi)$ [N]
dynamic moment Gd^2, moment of inertia J due to a motion of translation (numerically $J = \frac{Gd^2}{4}$)	$Gd^2 = \frac{365 \cdot G \cdot v^2}{n^2}$ [kgf m^2]	$J = \frac{m \cdot v^2}{\omega^2}$ [kg m^2]
torque as a function of a force, of a dynamic moment or of a moment of inertia, of a power	$M = \frac{F \cdot d}{2}$ [kgf m] $M = \frac{Gd^2 \cdot n}{375 \cdot t}$ [kgf m] $M = \frac{716 \cdot P}{n}$ [kgf m]	$M = F \cdot r$ [N m] $M = \frac{J \cdot \omega}{t}$ [N m] $M = \frac{P}{\omega}$ [N m]
work, energy in motion of translation, in rotary motion	$W = \frac{G \cdot v^2}{19,6}$ [kgf m] $W = \frac{Gd^2 \cdot n^2}{7160}$ [kgf m]	$W = \frac{m \cdot v^2}{2}$ [J] $W = \frac{J \cdot \omega^2}{2}$ [J]
power in motion of translation, in rotary motion	$P = \frac{F \cdot v}{75}$ [CV] $P = \frac{M \cdot n}{716}$ [CV]	$P = F \cdot v$ [W] $P = M \cdot \omega$ [W]
power available at the shaft of a single-phase motor (cos φ = power factor)	$P = \frac{U \cdot I \cdot \eta \cdot \cos \varphi}{736}$ [CV]	$P = U \cdot I \cdot \eta \cdot \cos \varphi$ [W]
power available at the shaft of a three-phase motor	$P = \frac{U \cdot I \cdot \eta \cdot \cos \varphi}{425}$ [CV]	$P = 1,73 \cdot U \cdot I \cdot \eta \cdot \cos \varphi$ [W]

Note. Acceleration or deceleration are understood constant; motion of translation and rotary motion are understood rectilinear and circular respectively.

Global presence local service

Local support
Sales, customer service, technical support, spare parts

15 branches*

Worldwide distribution network*

A global network of subsidiaries and dealers. From design and execution to after-sales service. Rossi is always close to you: a local, reliable and flexible partner.

Alongside our 24/7 **Rossi for You** portal you have a suite of digital support tools enabling real time access to your order tracking, invoices, spare part tables download and contact to our service.

*All contacts available on **www.rossi.com**

Index of revisions

LIst of main updatings - G Edition 2590-02.00

Added former catalogs:
G Addition (sizes 400, 401)
RE drive units on swing base for the contents relevant to G drives

Added the "long version" for sizes 80, 81 MR 2I and 3I
